About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**MARINE ENERGY – WAVE, TIDAL AND
OTHER WATER CURRENT CONVERTERS –****Part 40: Acoustic characterization of marine energy converters**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
<https://standards.iteh.ai/catalog/standards/sist/bb922533-4aef-44e9-b0f9->
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. In exceptional circumstances, a technical committee may propose the publication of a technical specification when

- the required support cannot be obtained for the publication of an International Standard, despite repeated efforts, or
- the subject is still under technical development or where, for any other reason, there is the future but no immediate possibility of an agreement on an International Standard.

Technical specifications are subject to review within three years of publication to decide whether they can be transformed into International Standards.

IEC TS 62600-40, which is a Technical Specification, has been prepared by IEC technical committee 114: Marine energy – Wave, tidal and other water current converters.

The text of this Technical Specifications based on the following documents:

Draft TS	Report on voting
114/297/DTS	114/307/RVDTS

Full information on the voting for the approval of this technical specification can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 62600 series, published under the general title *Marine energy – Wave, tidal and other water current converters*, can be found on the IEC website.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

ITeH STANDARD PREVIEW
(standards.iteh.ai)

A bilingual version of this publication may be issued at a later date.
<https://standards.iteh.ai/catalog/standards/sist/b6922955-4ac1-44e9-b0f9-27aabcd5e172/iec-ts-62600-40-2019>

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

The purpose of this document is to provide uniform methodologies that will ensure consistency and accuracy in the measurement and analysis of acoustical emissions from marine energy converters. These systems include wave, current (tidal, ocean, and river), and ocean thermal energy conversion. The document provides guidance on the measurement, analysis, and reporting of acoustic emissions from marine energy converters and has been prepared with the anticipation that it would be applied by:

- Marine energy converter manufacturers striving to meet well-defined acoustic emission performance requirements and/or a possible declaration system;
- Purchasers of marine energy converters to specify such performance requirements;
- Operators of marine energy converters who may be required to verify that stated, or required, acoustic performance specifications are met for new or refurbished units;
- Operators of marine energy test sites, who may be required to assess conformity with consented acoustic levels at their sites;
- Marine energy converter planners or regulators who must be able to accurately and fairly define acoustical emission characteristics of marine energy converters in response to environmental regulations or permit requirements for new or modified installations.

The methods and reporting requirements in this document ensure that continuing development and operation of marine energy converters is carried out in an atmosphere of consistent and accurate communication relative to environmental concerns.

MARINE ENERGY – WAVE, TIDAL AND OTHER WATER CURRENT CONVERTERS –

Part 40: Acoustic characterization of marine energy converters

1 Scope

This part of IEC 62600 provides uniform methodologies to consistently characterize the sound produced by the operation of marine energy converters that generate electricity, including wave, current, and ocean thermal energy conversion. This document does not include the characterization of sound associated with installation, maintenance, or decommissioning of these converters, nor does it establish thresholds for determining environmental impacts. Characterization refers to received levels of sound at particular ranges, depths, and orientations to a marine energy converter. Informative Annex B provides guidance on additional measurements that would be necessary to estimate source levels.

The scope of this document encompasses methods and instrumentation to characterize sound near marine energy converters, as well as the presentation of this information for use by regulatory agencies, industry, and researchers. Guidance is given for instrumentation calibration, deployment methods around specific types of marine energy converters, analysis procedures, and reporting requirements.

This document is applicable to the characterization of sound from individual converters and arrays. This document primarily describes measurement procedures for individual converters, with extension to arrays discussed in informative Annex A.

3 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC TS 62600-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

3.1

acoustic self-noise

sound at a receiver caused by the deployment, operation, or recovery of the receiver, and its associated platform

[SOURCE: ISO 18405:2016, 2.1.1.15]

3.2

ambient noise

all sound, except **acoustic self-noise** and sound associated with a specified signal

[SOURCE: ISO 18405:2016, 2.1.1.6, modified – Notes not relevant to this document have been removed.]

3.3

flow-noise

non-acoustic pressure fluctuations measured by a pressure-sensitive instrument

Note 1 to entry: This is sometimes referred to as “hydrodynamic noise”.

Note 2 to entry: Moving water can also excite structures, causing them to radiate acoustic pressure, but this is categorized as acoustic self-noise.

3.4

mean-square sound pressure spectral density

distribution as a function of frequency of the mean-square sound pressure per unit bandwidth of a sound having a continuous spectrum

Note 1 to entry: Mean-square sound pressure spectral density is expressed in units of pascal squared per hertz (Pa^2/Hz).

Note 2 to entry: For operational purposes, mean-square sound pressure spectral density is estimated as the mean-square sound pressure in a finite frequency band divided by the frequency bandwidth. The averaging time and frequency band shall be specified.

[SOURCE: ISO 18405: 2016, 2.1.3.13, modified – Notes 2, 4, and 5, which are not relevant to this document, have been removed, as has the preferred formula.]

3.5

mean-square sound pressure spectral density level

ten times the logarithm to the base 10 of the ratio of the **mean-square sound pressure spectral density** to the specified reference value, in decibels

Note 1 to entry: Mean-square sound pressure spectral density level is the level of the power quantity mean-square sound pressure spectral density.

Note 2 to entry: Mean-square sound pressure spectral density level is expressed in decibels.

Note 3 to entry: In underwater acoustics, the reference value of mean-square sound pressure spectral density is $1 \mu\text{Pa}^2/\text{Hz}$.

[SOURCE: ISO 18405:2016, 2.2.1.10, modified – Symbolic notation and formulas from the definition and Notes 1 and 3 have been removed and Note 4 has been removed because it is not relevant to this document.]

3.6

marine energy converter sound pressure level

ten times the logarithm to the base 10 of the ratio of the integrated mean-square sound pressure spectral density over the measurement frequency range to the specified reference value, in decibels

Note 1 to entry: Marine energy converter sound pressure level is expressed in decibels.

Note 2 to entry: The reference value is $1 \mu\text{Pa}^2$ – see: mean-square sound pressure spectral density level.

3.7

decidecade sound pressure level

ten times the logarithm to the base 10 of the ratio of the integrated **mean-square sound pressure spectral density** over a specified decidecade frequency band to the specified reference value, in decibels

Note 1 to entry: The frequency ratio corresponding to a decidecade (1 ddec) is $10^{0.1}$. One decidecade (0,1dec) is equal to $0,1 \log_2(10)$.

Note 2 to entry: Decidecade bands are defined in IEC 61260-1:2014 as “one-third octave bands”.

Note 3 to entry: Decidecade sound pressure level is expressed in decibels (dB).

Note 4 to entry: The reference value is $1 \mu\text{Pa}^2$ – see: mean-square sound pressure spectral density level.

3.8

sound pressure

difference between instantaneous total pressure and pressure that would exist in the absence of sound waves

Note 1 to entry: Sound pressure is expressed in pascals (Pa).

[SOURCE: ISO 18405:2016, 2.1.2.1, modified – Notes 2, 3, 4, and 5, which are not relevant to this document, have been removed, the preferred formula has been removed, and it has been made explicit that this is an instantaneous quantity.]

3.9

self-noise

fluctuations in signal caused by the combination of **acoustic self-noise** and non-acoustic self-noise

Note 1 to entry: An example of acoustic self-noise is hydrodynamic excitation of the sound measurement system that generates propagating sound.

Note 2 to entry: An example of non-acoustic self-noise is electrical noise internal to the sound measurement system electronics.

[SOURCE: ISO 18405:2016, 2.6.1.6, modified – Note 1, which is not relevant to this document, has been removed and notes have been added with examples of acoustic self-noise and non-acoustic self-noise.]

4 Symbols and abbreviated terms

H_{m0}	significant wave height
T_e	energy period
$L_{p,f}$	mean-square sound pressure spectral density level
$L_{p,ddec}$	decidecade sound pressure level
$L_{p,MEC}$	marine energy converter sound pressure level
$\overline{V_f^2}$	mean-square voltage spectral density
$\overline{p_f^2}$	mean-square sound pressure spectral density
CEC	current energy converter
MEC	marine energy converter
OTEC	ocean thermal energy converter
WEC	wave energy converter
AEP	annual energy production

5 Outline of method

Measurements of underwater sound around marine energy converters (MECs) are undertaken to characterize MEC sound. This document focuses on measurements of underwater sound utilizing hydrophones, which are sensitive to fluctuations in acoustic and non-acoustic pressure. Deployment mechanisms to minimize measurement contamination by non-acoustic pressure fluctuations are given for each class of MEC, specifically current energy converters (CECs), wave energy converters (WECs), and Ocean Thermal Energy Conversion (OTEC) systems. These measurements are complemented by contextual observations of metocean conditions, sound speed profiles, and MEC operation (e.g., rated capacity, annual energy production (AEP)). The acoustic frequencies of interest for these measurements coincide with those of aquatic species, extending from a few Hz to over one hundred kHz. Two levels of characterization are described. Level A characterization describes the temporal and spatial characteristics of MEC sound. Level B characterization describes the characteristics of MEC sound at reduced temporal and spatial detail. Both levels utilize the same instrumentation, analysis, and reporting. “Level B” characterization is included within the document to provide a mechanism for reduced-effort reconnaissance surveys to be compliant with the specification. For example, a Level B characterization might be sufficient for a prototype demonstration of a MEC, whereas as Level A characterization might be more suitable for a commercial deployment. For both levels of characterization, analysis requires identifying, from all collected acoustic samples, a sufficient valid set at specified marine energy converter operational conditions and spatial positions. Measurement procedures for the three classes of MEC are summarized in Table 1.
