This European Standard was approved by CEN on 14 July 2006.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Central Secretariat or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Central Secretariat has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

Foreword

This document (EN 15157:2006) has been prepared by Technical Committee CEN/TC 184 "Advanced technical ceramics", the secretariat of which is held by BSI.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by February 2007, and conflicting national standards shall be withdrawn at the latest by February 2007.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[SIST EN 15157:2007](#)

<https://standards.iteh.ai/catalog/standards/sist/9e9e431a-d6b8-44af-8ebb-830f53a51d4a/sist-en-15157-2007>

1 Scope

This European Standard specifies the conditions for the determination of constant-amplitude of load or strain in uniaxial tension/tension or in uniaxial tension/compression cyclic fatigue properties of ceramic matrix composite materials (CMCs) with fibre reinforcement for temperature up to 1 700 °C in air at atmospheric pressure.

This European Standard applies to all ceramic matrix composites with fibre reinforcement, unidirectional (1D), bi-directional (2D), and tri-directional (xD, where $2 < x \leq 3$).

The purpose of this European Standard is to determine the behaviour of CMC when subjected to mechanical fatigue and oxidation simultaneously. Tests for the determination of fatigue properties at high temperature in inert atmospheres differ from those in oxidative atmospheres. Contrary to an inert atmosphere, damage in an oxidative atmosphere accumulates due to the influence of purely mechanical fatigue and to chemical effects of the material's oxidation.

3 Terms, definitions and symbols

For the purposes of this document, the terms and definitions given in prCEN/TR 13233:2007 and the following apply.

3.1

test temperature, T

temperature of the test specimen at the centre of the gauge length

3.2

calibrated length, l

part of the test specimen which has uniform and minimum cross-section area

3.3

gauge length, L_0

initial distance between reference points on the test specimen in the calibrated length

3.4

controlled temperature zone

part of the calibrated length including the gauge length where the temperature is within 50 °C of the test temperature

3.5

initial cross-section area, S_0

initial cross-section area of the test specimen within the calibrated length, at the test temperature

NOTE Two initial cross-section areas of the test specimen can be defined:

- apparent cross-section area: this is the total area of the cross-section $S_{0\text{ app}}$;
- effective cross-section area: this is the total area corrected by a factor, to account for the presence of a coating,

$S_{0\text{ eff}}$

3.6

longitudinal deformation, A

change in the gauge length between reference points under an uniaxial force

3.7

strain, ε

relative change in the gauge length defined as the ratio A/L_0

3.8

stress, σ

force supported by the test specimen at any time in the test, divided by the initial cross-section area

NOTE Two stresses can be distinguished:

- apparent stress, σ_{app} , when the apparent cross-section area (or total cross-section area) is used;
- effective stress, σ_{eff} , when the effective cross-section area is used.

Stress can be either in tension or in compression.

3.9

constant amplitude loading

in cyclic fatigue loading, constant wave form loading in which the peak loads and the valley loads are kept constant during the test (see Figure 1 for nomenclature relevant to cyclic fatigue testing)

Figure 1 — Cyclic fatigue nomenclature and wave forms

3.10 Cyclic fatigue phenomena

3.10.1

load ratio, R

in cyclic fatigue loading, algebraic ratio of the two loading parameters of a cycle

NOTE The most widely used ratios are:

$$R = (\text{minimum load}/\text{maximum load}) \text{ or}$$

$$R = (\text{valley load}/\text{peak load}).$$

3.10.2 stress cyclic fatigue

3.10.2.1

maximum stress, σ_{\max}

maximum applied stress during cyclic fatigue

3.10.2.2

minimum stress, σ_{\min}

minimum applied stress during cyclic fatigue

3.10.2.3**mean stress, σ_m**

average applied stress during cyclic fatigue such that:

$$\sigma_m = (\sigma_{\max} + \sigma_{\min})/2$$

3.10.2.4**stress amplitude, σ_a**

difference between the maximum stress and the minimum stress, such that:

$$\sigma_a = (\sigma_{\max} - \sigma_{\min})/2 = \sigma_{\max} - \sigma_m = \sigma_m - \sigma_{\min}$$

3.10.3 Strain cyclic fatigue**3.10.3.1****maximum strain, ε_{\max}**

maximum applied strain during cyclic fatigue

3.10.3.2**minimum strain, ε_{\min}**

minimum applied strain during cyclic fatigue

3.10.3.3**mean strain, ε_m**

average applied strain during cyclic fatigue such that:

$$\varepsilon_m = (\varepsilon_{\max} + \varepsilon_{\min})/2$$

3.10.3.4**strain amplitude, ε_a**

difference between the maximum stress and the minimum stress, such that:

$$\varepsilon_a = (\varepsilon_{\max} - \varepsilon_{\min})/2 = \varepsilon_{\max} - \varepsilon_m = \varepsilon_m - \varepsilon_{\min}$$

3.10.4 Fatigue parameters**3.10.4.1****number of cycles, N**

total number of loading cycles which is applied to the test specimen during the test

3.10.4.2**cyclic fatigue life, N_f**

total number of loading cycles which is applied to the test specimen up to failure

3.10.4.3**time to failure, t_f**

time duration required to obtain the number of cycles N_f

3.10.5 Stress-strain curve parameters

Stress-strain curve parameters are defined as given in Figure 2.

iTeh STANDARD PREVIEW

[SIST EN 15157:2007](https://standards.iteh.ai/catalog/standards/sist/9e9e431a-d6b8-44af-8ebb-830f53a51d4a/sist-en-15157-2007)

<https://standards.iteh.ai/catalog/standards/sist/9e9e431a-d6b8-44af-8ebb-830f53a51d4a/sist-en-15157-2007>

4 Principle

A test specimen of specified dimensions is heated to the testing temperature and tested in cyclic fatigue as follows:

- method A: the test specimen is cycled between two constant stress levels at a specified frequency;
- method B: the test specimen is cycled between two constant strain levels at a specified frequency.

The total number of cycles is recorded. If strain is not determined, only the life-time duration or the residual mechanical properties can be determined. If strain is determined, a number of stress-strain cycles are recorded at specified intervals to determine damage parameters, in addition to the life-time duration and residual mechanical properties.

NOTE Residual properties can be determined on the test specimens which have not failed during the test, using the methods described in the appropriate European Standards.

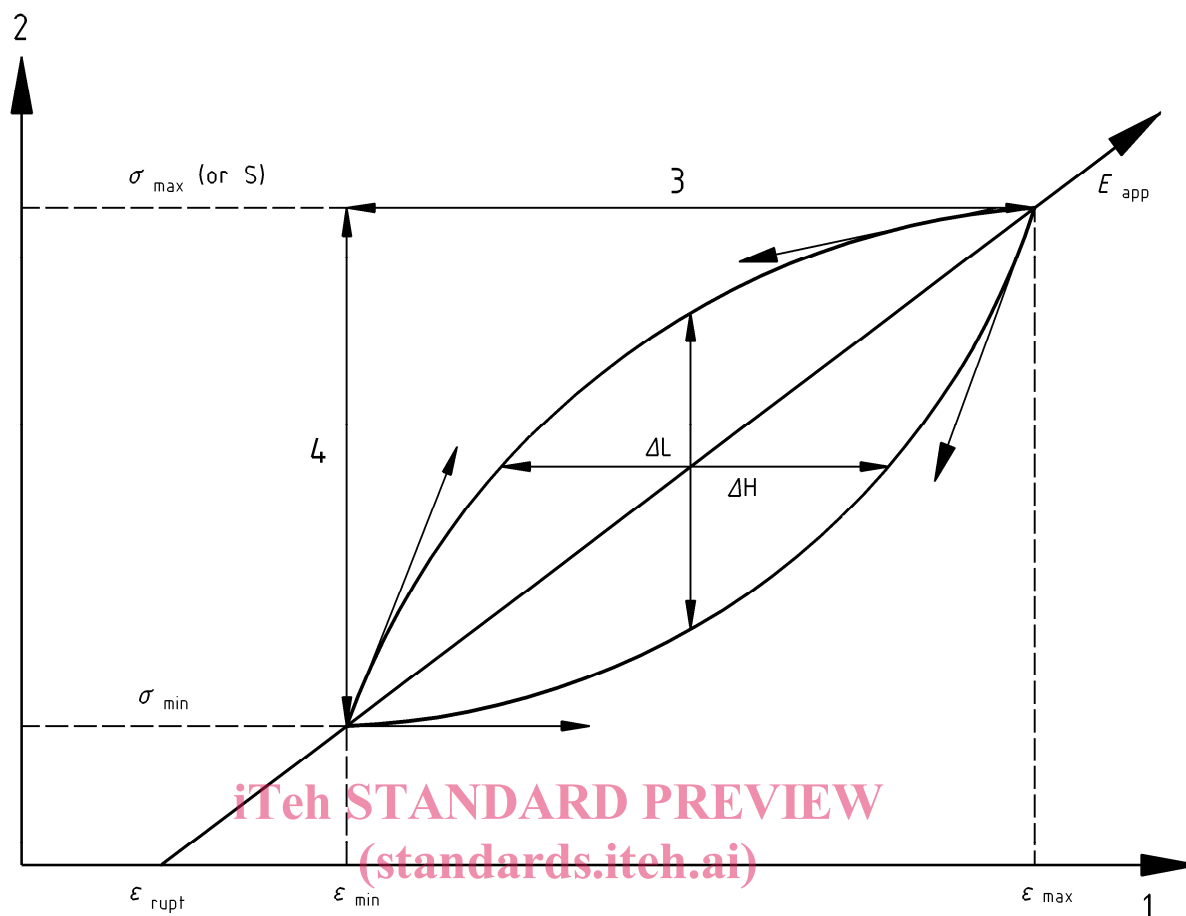

5 Significance and use

This test method enables characterization of the cyclic fatigue behaviour at constant amplitude of CMCs subjected to long duration loading. The simplest way to determine the fatigue properties of a material is to establish life-time diagrams. In these diagrams, the time to failure (or the cyclic fatigue life) is plotted versus stress (or strain) amplitude.

The complete life-time diagram requires the use of a great number of test specimens, which is expensive and time consuming. Hence, it is sufficient to know the cyclic-fatigue under specified stress (or strain) conditions, or to measure the fatigue limit. In any case, the typical fatigue test is defined by cyclic loading, constant amplitude, environment, temperature and frequency.

To better characterize the mechanical behaviour during a fatigue test, it is possible to determine several mechanical parameters from stress-strain curves. These parameters can then be plotted versus time or versus number of cycles. This displays the damage evolution during the cyclic loading. The following parameters can be considered (see Figure 2):

- the residual strain at zero load;
- the secant elastic modulus, or the relative damage parameters;
- the area of the stress-strain hysteresis loop, or the internal friction;
- the maximum strain, the minimum strain, or the difference between them for a selected cycle;
- some specific tangent elastic moduli, for example at the top or at the bottom of the stress-strain loop.

Key

- 1 strain (ϵ)
- 2 stress (σ)
- 3 width (L)
- 4 height (H)

Figure 2 — Parameters that can be considered to assess the cyclic fatigue behaviour

6 Apparatus**6.1 Fatigue test machine**

The fatigue test machine shall be of a hydraulic type and shall be load control operated or strain control operated.

The system for measuring the force applied to the test specimen shall be specially designed for fatigue tests and shall conform to grade 1 or better in accordance with EN ISO 7500-1. This shall apply during actual test conditions. The machine shall be equipped with a cycle counter for the chosen test frequency.

6.2 Load train

The load train configuration shall ensure that the load indicated by the load cell and the load experienced by the test specimen are the same.
