Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see <https://patents.iec.ch>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared jointly by Technical Committee ISO/TC 22, *Road vehicles*, Subcommittee SC 31, *Data communication*, Technical Committee IEC/TC 69, *Electrical power/energy transfer systems for electrically propelled road vehicles and industrial trucks*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 301, *Electrically propelled road vehicles*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

A list of all parts in the ISO 15118 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

The pending energy crisis and necessity to reduce greenhouse gas emissions started in the former century has led the vehicle manufacturers to a very significant effort to reduce the energy consumption of their vehicles up to the present. As countermeasures to this continuous problem, they developed vehicles partly or completely propelled by electric power and launched them into the market. Those vehicles will reduce the dependency on oil, improve the global energy efficiency and reduce the total CO₂ emissions for road transportation if the electricity is produced from renewable sources. To charge electricity to the batteries of such vehicles, a specific charging infrastructure is required.

Much of the standardization work on dimensional and electrical specifications of the charging infrastructure for electric vehicles and the vehicle interface were treated in the relevant ISO or IEC groups. However, the standardization work about direct information transfer between the electric vehicle and the charging infrastructure was not enough, and it was assigned to the ISO 15118 series to treat the subject sufficiently.

Such communication is necessary for the optimization of energy resources and energy production systems. With it electric vehicles can be connected to the supply network and communicate the most economic or most energy efficient way for charging/discharging. It is also required to develop efficient and convenient billing systems in order to cover the resulting payments. The necessary communication channel can serve in the future to contribute to the stabilization of the supply network as well as to support additional information services required to operate electric vehicles efficiently and economically.

After the standardization work of the first basic smart charging was completed, more standardization work for further evolved functions and high energy efficiency was continuously requested again.

It includes:

- improved charge methods that reduces efforts and agonies of the charging operation;
- extended functions for the electric vehicles to be utilized as distributed energy resources, which enable smoothing of the electricity load of the supply network for higher energy efficiency and also provide power back to the grid;
- information services for the user with higher added value and new convenience.

As for the communication system, the next evolution will be expected to realize these new applications.

Road vehicles — Vehicle to grid communication interface —

Part 20: Network and application protocol requirements

1 Scope

This document specifies the communication between the electric vehicle (EV), including battery electric vehicle (BEV) and plug-in hybrid electric vehicle (PHEV), and the electric vehicle supply equipment (EVSE). The application layer messages defined in this document are designed to support the electricity power transfer between an EV and an EVSE.

This document defines the communication messages and sequence requirements for bidirectional power transfer.

This document furthermore defines requirements of wireless communication for both conductive charging and wireless charging as well as communication requirements for automatic connection device and information services about charging and control status.

The purpose of this document is to detail the communication between an electric vehicle communication controller (EVCC) and a supply equipment communication controller (SECC). Aspects are specified to detect a vehicle in a communication network and enable an Internet Protocol (IP) based communication between the EVCC and the SECC (see Figure 1).

Key

- 1 scope of this document
- 2 message definition considers use cases defined for communication between SECC to SA

Figure 1 — Communication relationship among the EVCC, SECC and SA

This document defines messages, data model, XML/EXI-based data representation format, usage of V2GTP, TLS, TCP and IPv6. These requirements belong to the 3rd until the 7th OSI layer model. In addition, the document describes main service sequences of conductive charging, wireless power transfer and bidirectional power transfer, and how data link layer services can be accessed from an OSI layer 3 perspective.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://standards.iteh.ai/catalog/standards/sist/384a50f6-2226-4241-9000-20-2022>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1 access point

AP
wireless communication device that allows the user to connect to other wireless or wired communication devices

3.2 authorization mode

authenticate and authorize the user account

Note 1 to entry: Authorization mode refers to *EIM* (3.17) and *PnC* (3.41).

3.3 automatic connection device pantograph

ACDP
components supporting the automatic connection and disconnection process for conductive energy transfer between an EV and EVSE via pantograph

3.4 basic charging

BC

charging based on PWM

Note 1 to entry: According to ISO/IEC 11889-1:2015, Annex A.

3.5**certificate**

electronic document which uses a digital signature to bind a public key with an identity

Note 1 to entry: The ISO 15118 series describe several certificates covering different purposes [e.g. contract certificate including the *EMAID* (3.19) and *OEM* (3.36) provisioning certificates].

3.6**charging limit**

set of physical constraints that is negotiated during a *service session* (3.50)

EXAMPLE Voltage, current, energy, power, etc.

3.7**charging session**

collection of charging transactions at a charge point related only to the charging of an electric vehicle assigned to a specific customer in a specific timeframe with a unique identifier

Note 1 to entry: The charging session is a subset of the *service session* (3.50).

3.8**charging station operator****CSO**

secondary actor responsible for the installation and operation of a charging infrastructure (including charging sites), and the management of electricity to provide the requested energy transfer services

Note 1 to entry: The term CSO for charge point operator is also used in other ISO 15118 documents. This term is not recommended for trademark reasons.

3.9**communication session**

sequence of time where *EVCC* (3.21) and *SECC* (3.47) interactively exchange digital information in order to manage charging or discharging the EV battery

Note 1 to entry: A communication session can be paused and resumed later several times. The communication session encapsulates zero or more energy transfer periods.

3.10**communication setup timer**

timer (3.61) monitoring the time between establishment of TLS connection and reception of SessionSetupRes by *EVCC* (3.21)

3.11**contract certificate**

certificate (3.5) issued for the *EVCC* (3.21) by an *eMSP* (3.20) *sub-CA* (3.57), which is used in XML signatures on application layer so that the *SECC* (3.47) or secondary actor can verify the signature created by the *EVCC* with the contract certificate issued for that EV

Note 1 to entry: The secondary actor uses the *EMAID* (3.19), which is part of the contract certificate's subject field, to authorize the EV for charging based on the *eMSP*'s associated e-mobility contract.

3.12

CP state

control pilot state

state according to control pilot function defined in IEC 61851-1

3.13

credential

piece of information attesting an entity's identity

3.14

cross certificate

certificate (3.5) containing the public key of an existing certificate of a CA in one organization (called cross-certified CA) but signed by a root CA of another organization (called cross-certifying CA)

Note 1 to entry: With cross-certification, an end-entity, who only trusts a cross-certifying root CA, can validate a certificate chain issued by the root CA of another organization through a cross certificate appended to the chain.

3.15

distinguished encoding rules

DER

method for encoding a data object, such as an ITU-T X.509 *certificate* (3.5), to be digitally signed or to have its signature verified

3.16

dynamic control mode

control mode for the communication

Note 1 to entry: Further Information can be found in ISO 15118-1.

Note 2 to entry: The *SECC* (3.47) controls the power flow and gives the *EVCC* (3.21) set points it should follow.

3.17

external identification means

EIM

authorization means that are handled outside of this document

3.18

elliptic curve cryptography

ECC

mechanism for implementing public-key cryptography based on the discrete logarithms by algebraic structure of elliptic curves

3.19

eMobility account identifier

EMAID

contract identification for the contract that is issued by the *eMSP* (3.20) and used by the *SECC* (3.47) or secondary actor to enable energy transfer and related services (including billing)

Note 1 to entry: The term contract ID is not used anymore in this document. It has been replaced by the term EMAID. The definition is still present for compatibility with ISO 15118-1.

3.20

eMobility service provider

eMSP

entity with which the customer has a contract for all services related to the EV energy transfer

iTeh STANDARD
PREVIEW
(standards.iteh.ai)

<https://standards.iteh.ai/catalog/standards/sist/384a50f6-32eb-42ec-8cde-712dd98c68c8/iso-15118-20-2022>

Note 1 to entry: Typically, the eMSP will include some of the other actors, like spot operator or EP, and has a close relationship with the distribution system operator and *meter* (3.33) operator. An *OEM* (3.36) or utility could also fulfil such a role.

Note 2 to entry: eMSPs validate *EMAIDs* (3.19) from their customers, which were received either from the EMOCH, other eMSPs or spot operators the customer is in relation with.

Note 3 to entry: eMSPs issue *EMAIDs* to their customers.

3.21

electric vehicle communication controller

EVCC

embedded system, within the vehicle, that implements the communication between the vehicle and the *SECC* (3.47) in order to support specific functions

Note 1 to entry: Such specific functions could be, e.g. controlling input and output channels, encryption, or data transfer between vehicle and *SECC*.

3.22

EVPowerProfile

scheme which contains the power limits for charging or discharging the battery during an energy transfer period

Note 1 to entry: Refer to definition of "energy transfer schedule" in ISO 15118-1.

Note 2 to entry: In *dynamic control mode* (3.16) it describes a simulation from the EVs perspective on the fastest charging profile in order to reach the *EVMaximumEnergyRequest* under the constraint of the minimum of the *EVSEMaximumChargePower* and *EVMaximumChargePower*.

EXAMPLE The schedule is calculated based on target setting, sales tariff table and grid schedule information, respecting the corresponding current limitations, i.e. using the lowest current value.

3.23

electric vehicle supply equipment ID

EVSEID

unique identification of the EVSE

3.24

electric vehicle supply equipment

EVSE

<conductive power transfer> conductors, including the phase(s), neutral and protective earth conductors, the EV couplers, attached plugs, and all other accessories, devices, power outlets or apparatuses installed specifically for the purpose of delivering energy from the premises wiring to the EV and allowing communication between them as necessary

3.25

electric vehicle supply equipment

EVSE

<wireless power transfer> off-board equipment comprising the *SECC* (3.47) and one or multiple supply devices working under the control of the same *SECC*

3.26

global address

IP address (3.28) with unlimited scope

3.27

high level communication charging

HLC-C

energy transfer phase during a *service session* (3.50)

3.28

IP address

address

IP-layer identifier for an interface or a set of interfaces

3.29

link-local address

IP address (3.28) with link-only scope that can be used to reach neighboring interfaces attached to the same link

3.30

maximum transfer unit

MTU

maximum size (in bytes) of the largest protocol data unit that the data link layer can pass onwards

3.31

message set

set of *V2G messages* (3.66) and parameters for the *EVCC* (3.21) or *SECC* (3.47) covering one or multiple use case elements

3.32

message timer

timer (3.61) monitoring the exchange of a request-response-pair

3.33

meter

analogic device able to measure the amount of energy used and to monitor it

3.34

multiplexed communication

MC

exchange of multiple messages with different payload types over the *V2GTP* (3.68) connection between the *EVCC* (3.21) and *SECC* (3.47)

3.35

node

device that implements IPv6

3.36

original equipment manufacturer

OEM

producer who manufactures products or components that are purchased by a company and retailed under that purchasing company's brand name

Note 1 to entry: OEM refers to the company that originally manufactured the product.

Note 2 to entry: When referring to automotive parts, OEM designates a replacement part made by the manufacturer of the original part.

3.37

OEM provisioning certificate

certificate (3.5) issued to the *EVCC* (3.21) by the *OEM* (3.36) to enable the provisioning of a *contract certificate* (3.11)

Note 1 to entry: It is securely requested and received from a secondary actor to uniquely identify the EVCC.

3.38**PE certificate**

leaf *certificate* (3.5) issued in *PE* (3.42) to a *private SECC* (3.43) by a PE private root CA or optionally by a PE sub CA, which is used in TLS so that the *EVCC* (3.21) can verify the authenticity of the private SECC

3.39**PE EVSE**

EVSE that is operating in a *private environment* (3.42) and is containing or being controlled by a *private SECC* (3.43)

3.40**performance time**

non-functional timing requirement defining the time a *V2G entity* (3.65) should not exceed when executing or processing certain functionality

Note 1 to entry: This is a fixed time value.

3.41**park and charge****PnC**

authorization mechanism using *certificates* (3.5) stored in the EV which does not require any user interaction

3.42**private environment****PE**

area of private responsibility with physical access limited to a small number of vehicles

3.43**private SECC**

SECC (3.47) operating in a *private environment* (3.42) that uses a *PE certificate* (3.38)

Note 1 to entry: *PE* (3.42) usually implies lower security. In most cases SECC requirements will also apply to a private SECC. In some specific cases, the SECC and private SECC requirements can be distinct. Those cases and requirements will be called out as such.

3.44**public SECC**

SECC (3.47) operating in a public environment that uses a *PE certificate* (3.38)

3.45**request-response message pair**

request message and the corresponding response message

3.46**request-response message sequence**

predefined sequence of *request-response message pairs* (3.45)

3.47
