ISO/IEC TR 14252:1996

**Abstract:** This guide presents an overview of open system concepts and their applications. Information is provided to persons evaluating systems based on the existence of, and interrelationships among, application software standards, with the objective of enabling application portability and system interoperability. A framework is presented that identifies key information system interfaces involved in application portability and system interoperability and describes the services offered across these interfaces. Standards or standards activities associated with the services are identified where they exist or are in progress. Gaps are identified where POSIX® Open System Environment services are not currently being addressed by formal standards. Finally, the concept of a profile is discussed with examples from several application domains.

**Keywords:** application portability, application interoperability, open system environments, profiles, POSIX®

Adopted as an International Standard by the  
International Organization for Standardization  
and by the  
International Electrotechnical Commission

## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The main task of technical committees is to prepare International Standards, but in exceptional circumstances a technical committee may propose the publication of a Technical Report of one of the following types:

- type 1, when the required support cannot be obtained for the publication of an International Standard, despite repeated efforts;
- type 2, when the subject is still under technical development or where for any other reason there is the future but not immediate possibility of an agreement on an International Standard;
- type 3, when a technical committee has collected data of a different kind from that which is normally published as an International Standard ("state of the art", for example).

Technical Reports of types 1 and 2 are subject to review within three years of publication, to decide whether they can be transformed into International Standards. Technical Reports of type 3 do not necessarily have to be reviewed until the data they provide are considered to be no longer valid or useful.

ISO/IEC TR 14252, which is a Technical Report of type 3, was prepared by Technical Committee ISO/IEC JTC 1, *Information technology*.

**IEEE Standards** documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Board. Members of the committees serve voluntarily and without compensation. They are not necessarily members of the Institute. The standards developed within IEEE represent a consensus of the broad expertise on the subject within the Institute as well as those activities outside of IEEE that have expressed an interest in participating in the development of the standard.

Use of an IEEE Standard is wholly voluntary. The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of all concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments on standards and requests for interpretations should be addressed to:

# Introduction

(This introduction is not a normative part of IEEE Std 1003.0-1995 or of ISO/IEC TR 14252:1996.)

## 1 Purpose

2 This guide describes the POSIX Open System Environment (POSIX OSE). It is  
3 intended to be used by anyone interested in using standards to construct an infor-  
4 mation processing system, including consumers, systems integrators, application  
5 developers, systems providers, and procurement agencies.

6 The scope of this guide is much broader than a single standard. This guide  
7 identifies standards from many different areas produced by many different organ-  
8 izations. The POSIX OSE is intended to be broad enough to cover the entire scope  
9 of general-purpose information processing systems. While the intent of this guide  
10 is to identify completely the user services for a general-purpose information pro-  
11 cessing system, it is acknowledged that this will take some time, and this version  
12 of the guide may be incomplete in areas that are still evolving.

13 It is important to note that this guide is not a base standard itself; it merely  
14 identifies standards that might be used when constructing a complete information  
15 processing system.

16 It is not appropriate to claim conformance to this guide because it contains no  
17 mandatory requirements. This guide is intended to be used only as a source of  
18 reference material.

19 Although this guide is a product of the IEEE POSIX standardization efforts, its  
20 scope is much broader than those efforts. IEEE POSIX is currently developing  
21 base standards and standardized profiles focused primarily on application pro-  
22 gramming interfaces. At the end of the introduction is a cross-reference of the  
23 POSIX standardization efforts and where they fit into the POSIX OSE. For a more  
24 detailed discussion of POSIX profiling projects, see Section 7.

25 The process of selecting standards for a particular application domain is called  
26 profiling. Recommendations for the production of different types of profiles are  
27 included in this guide.

28 It may never be necessary to implement an information processing system that  
29 provides an implementation of every standard in the POSIX OSE.

30 In addition to listing and categorizing existing standards efforts, this guide  
31 identifies important services that standards have not yet addressed. In areas  
32 where these services are not addressed, emerging standards efforts and existing  
33 public specifications are described. These emerging standards and public  
34 specifications are not part of the POSIX OSE. They are included in this guide to  
35 identify some of the existing work that has been done in areas that are gaps in  
36 the POSIX OSE. This guide does not promote the use of these specifications that  
37 are outside the POSIX OSE. They are included for information purposes only.

38 User needs and standards to meet those services are continuously expanding. As  
39 such, this guide will need regular revision to incorporate new user services and

40 the new standards that evolve to meet those user needs.

## 41 **The POSIX OSE Reference Model**

42 To describe the POSIX OSE, this guide develops a reference model used to classify  
43 information processing standards. The reference model categorizes standards at  
44 two types of interfaces:

### 45 ***Application Program Interface (API) Standards***

46 These standards govern how application software interacts with the  
47 computer system. These standards affect application portability.

### 48 ***External Environment Interface (EEI) Standards***

49 These standards affect how an information processing system interacts  
50 with its external environment. These standards affect system interoper-  
51 ability, user interface usability, and data portability.

52 These standards allow users to procure portions of their information processing  
53 systems independently from multiple vendors according to the needs of each user.

54 The services provided at the interfaces are classified into four major categories:

- 55 — System services
- 56 — Communication services
- 57 — Information services
- 58 — Human/Computer interaction services

59 Within these categories, service component areas are identified.

60 Using the reference model, a general set of services for each component area is  
61 developed. For each of the services, existing or emerging standards are identified  
62 that address each of the services. If a service is not completely addressed by an  
63 existing or emerging standard, this gap in the standards is noted.

## 64 **Goals**

65 The POSIX OSE described in this guide should provide services to satisfy the fol-  
66 lowing objectives, summarized from 3.1.

### 67 ***Application Portability at the Source Code Level***

68 To allow for movement of source code and data to a variety of applica-  
69 tion platforms

### 70 ***System Interoperability***

71 To allow application software and application platform interoperability

### 72 ***User Portability***

73 To allow people to use a wide range of application platforms without  
74 retraining

### 75 ***Accommodation of Standards***

76 To provide users and vendors with information about key interface  
77 specifications related to OSE objectives

- 78        ***Accommodation of New Information System Technology***  
79            To allow for migration to new technologies and a variety of marketplace  
80            solutions
- 81        ***Application Platform Scalability***  
82            To allow portability and software reuse across application platform  
83            types
- 84        ***Distributed System Scalability***  
85            To assure that related standards do not inappropriately limit the  
86            growth of distributed systems
- 87        ***Implementation Transparency***  
88            To allow the widest latitude in providing consistent and standard inter-  
89            faces to the application, regardless of the underlying implementation  
90            technology
- 91        ***Functional Requirements of the User***  
92            To allow clear statement of user needs and provide context for identify-  
93            ing related standards

94        **Benefits**

95        The following items are some of the benefits derived from the use of POSIX OSE.

96        ***Integration of Components From Multiple Vendors***

97            As the standards for system integration and system interoperability are  
98            produced and implemented, users will have the choice of mixing  
99            software and equipment from multiple vendors. This will allow users to  
100           tailor their information processing system to their particular needs by  
101           selecting hardware and software based on the needs of the application  
102           rather than the ability of the hardware and software to interoperate  
103           with the existing equipment.

104        ***Efficient Development and Implementation***

105           Normally, systems users and providers have development and imple-  
106           mentation activities that utilize personnel possessing skills in a specific  
107           computer environment. As a result of this specialization, a change in  
108           the target computer environment for a developer requires significant  
109           retraining expense. As standards for application portability, system  
110           interoperability, and system integration are developed, computer per-  
111           sonnel will begin to develop skills in working with these standards.

112           This will allow a company to hire personnel with existing skills that can  
113           be put to use in their operation. In addition, within a company,  
114           resources can be redeployed between development efforts with a  
115           minimum of retraining.

116        ***Efficient Porting of Applications***

117           The difficulty of moving an application from one hardware or software  
118           environment to another is widely known. The porting of an application  
119           that uses standards-based interfaces to another system that provides  
120           the same standards-based interfaces is considerably simpler than ports  
121           involving completely different systems. The amount of system tailoring

122 (i.e., changes to either the operating or application system required to  
 123 make them work well together) is greatly reduced.

## 124 **Related Standards Activities**

125 In addition to this guide, the Portable Applications Standards Committee (PASC)  
 126 has authorized other standards activities that are related to the content of this  
 127 guide.

128 The following table summarizes the current PASC standardization efforts<sup>1)</sup> and  
 129 how they relate to sections of this guide:

130	<b>Project</b>	<b>Standard/Profile</b>	<b>Section</b>
131	P1003.1, .1a	System Interfaces	4.2
132	P1003.1b, .1d	Realtime (formerly P1003.4)	4.2
133	P1003.1c	Threads (formerly P1003.4)	4.2
134	P1003.1e	Security API (formerly P1003.6.1)	5.2
135	P1003.1f	Transparent File Access (formerly P1003.8)	4.3
136	P1003.1g	Protocol-Independent Network API (formerly P1003.12)	4.3
137	P1003.2, .2b	Shell and Utilities	4.7
138	P1003.2c	Security Utilities (formerly P1003.6.2)	5.2
139	P1003.2d	Batch Queueing Extensions	4.7
140	P1003.5	Ada Bindings	4.1
141	P1003.5b	Ada Realtime Binding (formerly P1003.20)	4.1
142	P1003.9	Fortran Bindings	4.1
143	P1003.10	Supercomputing Profile	7.2
144	P1003.13	Realtime Profile	7.2
145	P1003.14	Multiprocessing Profile	7.2
146	P1003.18	POSIX Platform Profile	7.2
147	P1003.21	Realtime Distributed Systems Communications	4.3
148	P1003.22	Guide to POSIX OSE Security Framework	5.2
149	P1201.1	Uniform API for Graphical User Interfaces	4.9
150	P1201.2	User Interface Drivability	4.9
151	P1224	OSI API — Abstract Data Manipulation	4.3
152	P1224.1	OSI API — X.400 Electronic Mail/Messaging	4.3
153	P1224.2	OSI API — X.500 Directory Services (formerly P1003.17)	4.3
154	P1238.0	OSI API Common Support Functions	4.3
155	P1238.1	OSI API FTAM Test Methods and C Binding	4.3
156	P1327	OSI API Abstract Data Manipulation — C Binding	4.3
157	P1327.1	OSI API X.400 — C Binding	4.3
158	P1327.2	OSI API X.500 — C Binding	4.3
159	P1387.n	System Administration (formerly P1003.7.n)	5.3

160 1) A *Standards Status Report* that lists all current IEEE Computer Society standards projects is  
 161 available from the IEEE Computer Society, 1730 Massachusetts Avenue NW, Washington, DC  
 162 20036-1903, USA; Telephone: +1 202 371-0101; FAX: +1 202 728-9614.

163	<u>Project</u>	<u>Standards/Profile</u>	<u>Section</u>
164	P2003.n	Test Methods (formerly P1003.3.n)	

165 Most these efforts are in the areas of API standards and standardized profiles.  
 166 Extensions are approved as “amendments” or “revisions” to this document, following IEEE  
 167 and ISO/IEC procedures.

168 Approved amendments are published separately until the full document is reprinted  
 169 and such amendments are incorporated in their proper positions.

170 If you have an interest in participating in the PASC working groups addressing these  
 171 issues, please send your name, address, and phone number to the Secretary, IEEE  
 172 Standards Board, Institute of Electrical and Electronics Engineers, Inc., P.O. Box 1331,  
 173 445 Hoes Lane, Piscataway, NJ 08855-1331, USA, and ask to have this forwarded to the  
 174 chairperson of the appropriate PASC working group. If you have an interest in  
 175 participating in this work at the international level, contact your ISO/IEC national body.

176 IEEE Std 1003.0-1995 was prepared by the IEEE P1003.0 working group, sponsored  
 177 by the Portable Applications Standards Committee of the IEEE Computer Society. At  
 178 the time this standard was approved, the membership of the P1003.0 group was as  
 179 follows:

**Portable Applications Standards Committee**

181 Chair: Lowell Johnson  
 182 Vice-Chairs: Jay Ashford  
 183 Andrew Josey  
 184 Barry Needham  
 185 Charles Severance  
 186 Jon Spencer  
 187 Secretary: Charles Severance
