DRAFT
prEN 50604-1

May 2014

ICS 29.220.30

English Version

**Secondary lithium batteries for LEV (Light Electric Vehicle)
applications - Part 1: General safety requirements and test
methods**

Batteries d'accumulateurs au lithium pour applications liées
aux véhicules électriques légers (VEL) - Partie 1: Exigences
générales de sécurité et méthodes d'essai

Sekundärbatterien für LEV - Anwendungen (Light Electric
Vehicle) - Teil 1: Allgemeine Sicherheitsanforderungen und
Prüfverfahren

This draft European Standard is submitted to CENELEC members for enquiry.
Deadline for CENELEC: 2014-10-03.

It has been drawn up by CLC/TC 21X.

If this draft becomes a European Standard, CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CENELEC in three official versions (English, French, German).
A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

59 Introduction

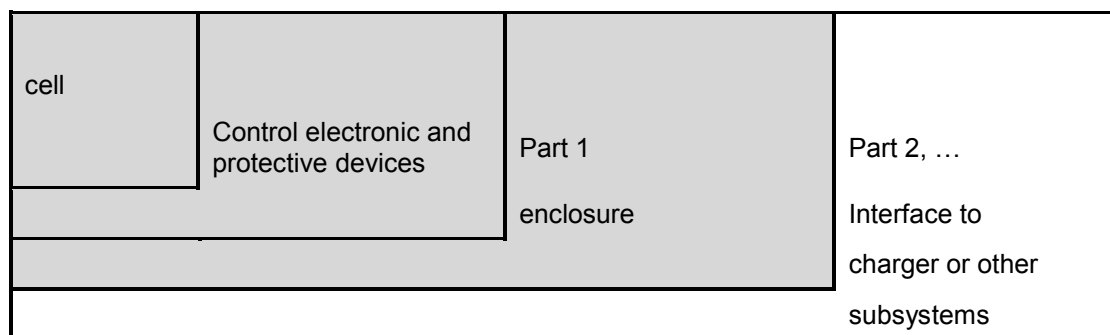

60 The goal of EN 50604 is to increase safety of battery packs (EPAC) which contain lithium battery techno-
 61 logies in combination with their chargers for use in light electric vehicles.

62 Part 1 sets definitions, safety issues and test procedures.

63 Part 2 sets construction rules.

64 EN 50604 was designed to assess aspects on battery pack level. The battery pack and its charger can be
 65 described as system comprising of following subsystems:

66

67

Figure 1 – Battery packs system and subsystems

68 The requirements to be met by subsystems are detailed in other parts of EN 50604.

SIST EN 50604-1:2016

<https://standards.iteh.ai/catalog/standards/sist/ad16d538-e27c-4310-b33e-06da73cdf554/sist-en-50604-1-2016>

1 General

1.1 Scope

This standard specifies test methods and requirements for secondary lithium batteries and its interface with an appropriate charging system for the safe use in EPACs.

This standard does not apply to performance and functional characteristics of batteries.

This standard refers to the UN Recommendations on the Transport of Dangerous Goods – Manual of Tests and Criteria: Section 38.3 which are performed independently from this testing program. Test reports issued by an ILAC, APLAC or similar accredited party are acceptable for the Battery complying with all aspects of Section 38.3 of Manual of Tests and Criteria of UN Recommendations on the Transport of Dangerous Goods for this test option.

This standard treats electric chargers only as far as it defines requirements for the interface between pack and charger which influence the safety of Li-battery-packs while being charged.

This standard does not cover batteries for electric vehicles covered by ISO 6469 and ISO 18246.

For cells: Relevant international standard IEC 62133, IEC 61960; IEC 62660.

This standard does not apply to:

- lithium cells;
- batteries other than lithium ion types;
- primary Batteries(including lithium types);
- lithium Battery Packs with a total weight exceeding 12 kg (UNT 38.3);
- batteries covered by ISO 12405 and ISO 18243.

1.2 General explanation

Test items were selected to simulate conditions likely to occur during the transport of batteries (either transported separately or when installed into the electric vehicle), during the handling (e. g. removal or replacement) or during the operation. They cover conditions of normal operation, rough handling and as well likely conditions of misuse or negligent handling. For electric vehicles operating under extreme conditions (e. g. off-road, extreme climate etc.) additional requirements may be necessary which are not covered by this standard.

Additional requirements might also apply to battery system after the integration into the vehicle resulting from national or regional regulations and are not dealt within this standard. Same applies to hazards from electric shock.

1.3 Subsystem requirements

Table 1 – subsystem requirements red in Part 2

Subsystem	Requirement
Protective devices	Corresponding IEC component standards ^a , or <ul style="list-style-type: none"> – Other component standards ensuring corresponding safety levels ^a – Controlling of charging/discharging process avoiding overcharge/overdischarge, of internal shortcircuits, respecting temperature limits detection – The device may be integrated in charger or battery pack
Enclosure	Mechanical strength to withstand stress caused by normal use and rough handling <ul style="list-style-type: none"> – Sufficiently resistant to degradation caused by sunlight radiation – Reducing the possibility of ignition and spread of flame – Providing suitable insulation characteristics – The housing of the battery pack has to be constructed in a way that it cannot be opened without the use of tools and any opening from not authorized people should be easily detectible e. g. by a broken seal to be defined by the manufacturer.
Charger	<ul style="list-style-type: none"> – IEC 61851 series, or – IEC 60335-1 and IEC 60335-2-29, or – Other product standards ensuring corresponding safety levels, and – IEC 60529 IP codes according to the designed use
–	<ul style="list-style-type: none"> – Charger and battery pack form a functional unit – Charger and battery are constructed in a way that they can undoubtedly identify each other before any energy transfer. <p>For the connection of the battery pack to the supply equipment no plug or socket shall be used with which a direct connection to any unintended power source e. g. a household AC-net can be realized (IEC/TR 683; IEC 60906-1; IEC 60320; IEC 60884; IEC 60309; EN 50075)</p>
Battery Pack	<ul style="list-style-type: none"> – The terminals have to be protected against accidental short circuit
^a Valid component certificate must be available.	

NOTE Test reports issued by an ILAC, APLAC or similar accredited party are acceptable.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

123 **3 Terms and definitions**

124 For the purposes of this document, the following terms and definitions apply.

125 **3.1 Batteries**

126 **3.1.1**

127 **active protective device**

128 devices integral to the battery pack or the charger requiring active external controls, that are intended for
 129 protection from or mitigation of abusive, out-of range conditions experienced by the cell or battery. The active
 130 device cuts the connection to the charger or to a consumer (e. g. a motor) if the controls detect a situation
 131 under which the battery could be damaged or become dangerous

132 EXAMPLES MOSFET, integrated circuits, microcontroller.

133 **3.1.2**

134 **ambient temperature**

135 temperature of the medium in the immediate vicinity of the battery

136 **3.1.3**

137 **battery assembly**

138 connection of two or more batteries in series or parallel.

139 Note 1 to entry: Such assemblies are not covered by the manual.

140 Note 2 to entry: Such assemblies must contain protective devices and/or electronic circuits.

141 **3.1.4**

142 **battery cell**

143 **cell**

144 single encased electrochemical unit (one positive and one negative electrode), which exhibits a voltage
 145 difference across its two terminals

146 **3.1.5**

147 **battery pack**

148 **battery**

149 two or more cells that are electrically connected by permanent means. It may include housing, terminals,
 150 electronic circuits, sensors, markings and protective devices. If the cells are integrated in a frame of the LEV,
 151 this frame means the housing of the cells

152 **3.1.6**

153 **cycle**

154 one sequence of fully charging and fully discharging a rechargeable battery within the limits specified by the
 155 manufacturer

- 156 **3.1.7**
 157 **enclosure**
 158 cabinet, box or container providing protection for the parts building the battery
- 159 Note 1 to entry: Specific requirements applying to enclosures are detailed in 3.4 and 5.2.
- 160 **3.1.8**
 161 **first cycle**
 162 initial cycle following the completion of all manufacturing processes
- 163 **3.1.9**
 164 **fresh battery**
 165 battery after the completion of all manufacturing processes, ready for use
- 166 **3.1.10**
 167 **fully charged**
 168 rechargeable battery, which has been electrically charged to its rated electrical capacity, as specified by the
 169 manufacturer
- 170 **3.1.11**
 171 **fully discharged**
 172 rechargeable battery, which has been electrically discharged to its cut-off voltage as specified by the
 173 manufacturer
- 174 **3.1.12**
 175 **lithium ion battery**
 176 rechargeable electrochemical battery in which the positive and negative electrodes are both intercalation
 177 compounds (intercalated lithium exists in an ionic form in the lattice of the electrode material) constructed
 178 with no metallic lithium in either electrode. A lithium polymer battery that uses lithium ion chemistries, as
 179 described herein, is regulated as a lithium ion battery.
- 180 **3.1.13**
 181 **passive protective device**
 182 devices that do not require active external control for operation and which are either integral or external to
 183 the cell
- 184 **EXAMPLES** Over-current fuse links, circuit breaker, thermal releases.
- 185 Note 1 to entry: Protective devices, which were not tested according to the relevant component standard, are not
 186 considered as protective device.
- 187 Note 2 to entry: Semiconductor devices with no interface for external control can be permitted if they are subject to
 188 testing according to the relevant component standard, e.g. IEC 61643-321:2001 for avalanche breakdown diodes.
- 189 **3.1.14**
 190 **prismatic battery**
 191 battery whose ends are similar, equal and parallel rectilinear figures, and whose sides are parallelograms
- 192 **3.1.15**
 193 **protective device**
 194 either an active protective device or passive protective device
- 195 **3.1.16**
 196 **rated capacity**
 197 capacity, in ampere-hours, of a battery as measured by subjecting it to a load specified by IEC 61960, 7.2.1,
 198 temperature and voltage cut-off point as specified by the manufacturer
- 199 **3.1.17**
 200 **rechargeable or secondary battery**
 201 batteries or cells that can be repeatedly electrically charged and discharged

202 **3.1.18**
 203 **short circuit**
 204 direct low resistance connection between positive and negative terminals of a battery that provides a virtual
 205 zero resistance path for current flow

206 **3.1.19**
 207 **swapable batteries**
 208 lithium battery with a gross mass of not exceeding 12 kg intended to be easily removable by the end-user

209 **3.1.20**
 210 **built-in batteries**
 211 lithium battery fixed, installed and connected to the vehicle. Only meant to be removed by authorised
 212 persons

213 **3.1.21**
 214 **subsystem**
 215 major portion or module that comprises the overall system

216 **3.1.22**
 217 **type**
 218 particular electrochemical system and physical design of a battery

219 **3.1.23**
 220 **watt-hour rating**
 221 unit of energy, which is calculated by multiplying the discharge current with the time integral of the voltage
 222 curve of a battery.

223 Energy, in watt-hours of a battery as measured by subjecting it to a load specified by IEC 61960, 7.2.1,
 224 temperature and voltage cut-off point as specified by the manufacturer.

225 Note 1 to entry: See ISO/CD 18243.

226 **3.2 Others**

227 **3.2.1**
 228 **fault condition**
 229 equipment operated not in accordance with the manufacturer's specification and accompanying documents
 230 and markings. Conditions can occur as result of negligent use (foreseeable misuse), accident, failure of
 231 components or materials or other situations

232 **3.2.2**
 233 **normal condition**
 234 equipment operated in accordance with the manufacturer's specification and accompanying documents and
 235 markings

236 **3.2.3**
 237 **single fault**
 238 single failure of any protection means integral to the battery/charger design. When the application of a single
 239 fault condition is required by tests of this manual, the equipment, circuit diagrams, and component speci-
 240 fications are to be examined to determine those fault conditions that are likely to occur. Consideration shall be
 241 taken for any active protective devices and passive protective devices, which could be either electrical
 242 protection means or mechanical protection means

243 Note 1 to entry: Examples of single faults include but are not limited to:

- 244 a) short circuits and open circuits of semiconductor devices and capacitors;
- 245 b) faults causing continuous dissipation in resistors designed for intermittent dissipation;
- 246 c) internal faults in integrated circuits causing excessive dissipation;
- 247 d) any mechanical conducting part to bridge or open the circuits.
