This European Standard was approved by CEN on 18 August 2007.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its <a href="https://standards.iteh.ai/catalog/standards/sist/1b8df958-000e-4068-82a9-">https://standards.iteh.ai/catalog/standards/sist/1b8df958-000e-4068-82a9-</a>

CEN members are the national standards bodies of Austria; Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

#### **Foreword**

This document (EN 15316-3-1:2007) has been prepared by Technical Committee CEN/TC 228 "Heating systems in buildings", the secretariat of which is held by DS.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by April 2008, and conflicting national standards shall be withdrawn at the latest by April 2008.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association (Mandate M/343), and supports essential requirements of EU Directive 2002/91/EC on the energy performance of buildings (EPBD). It forms part of a series of standards aimed at European harmonisation of the methodology for calculation of the energy performance of buildings. An overview of the whole set of standards is given in prCEN/TR 15615.'

The subjects covered by CEN/TC 228 are the following:

- design of heating systems (water based, electrical etc.);
- installation of heating systems;
  - iTeh STANDARD PREVIEW
- commissioning of heating systems;
  - (standards.iteh.ai)
- instructions for operation, maintenance and use of heating systems;
- methods for calculation of the design heat loss and heat loads:
- methods for calculation of the energy performance of heating systems.

Heating systems also include the effect of attached systems such as hot water production systems.

All these standards are systems standards, i.e. they are based on requirements addressed to the system as a whole and not dealing with requirements to the products within the system.

Where possible, reference is made to other European or International Standards, a.o. product standards. However, use of products complying with relevant product standards is no guarantee of compliance with the system requirements.

The requirements are mainly expressed as functional requirements, i.e. requirements dealing with the function of the system and not specifying shape, material, dimensions or the like.

The guidelines describe ways to meet the requirements, but other ways to fulfil the functional requirements might be used if fulfilment can be proved.

Heating systems differ among the member countries due to climate, traditions and national regulations. In some cases requirements are given as classes so national or individual needs may be accommodated.

## EN 15316-3-1:2007 (E)

In cases where the standards contradict with national regulations, the latter should be followed.

EN 15316 Heating systems in buildings — Method for calculation of system energy requirements and system efficiencies consists of the following parts:

- Part 1: General
- Part 2-1: Space heating emission systems
- Part 2-3: Space heating distribution systems
- Part 3-1: Domestic hot water systems, characterisation of needs (tapping requirements)
- Part 3-2: Domestic hot water systems, distribution
- Part 3-3: Domestic hot water systems, generation
- Part 4-1: Space heating generation systems, combustion systems (boilers)
- Part 4-2: Space heating generation systems, heat pump systems
- Part 4-3: Heat generation systems, thermal solar systems
- Part 4-4: Heat generation systems, building-integrated cogeneration systems
- Part 4-5: Space heating generation systems, the performance and quality of district heating and large volume systems

  (standards.iteh.ai)
- Part 4-6: Heat generation systems, photovoltaic systems
- Part 4-7: Space heating generation systems, biomass combustion systems, 000e-4068-82a9-

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

# Introduction

This European Standard is one of a number of standards that together describe methods for calculation of system energy requirements and system efficiencies related to domestic hot water systems. In particular this European Standard describes methods for calculation of the energy needs for domestic hot water.

The user needs to refer to other European Standards or to national documents for input data and detailed calculation procedures not provided by this European Standard.

Only the calculation methods are normative. Values necessary to complete the calculations should be given in a national annex. Informative values are given in informative Annex A.

# iTeh STANDARD PREVIEW (standards.iteh.ai)

<u>SIST EN 15316-3-1:2007</u> https://standards.iteh.ai/catalog/standards/sist/1b8df958-000e-4068-82a9-745b738611e5/sist-en-15316-3-1-2007

## 1 Scope

This European Standard is part of a set of standards covering methods for calculation of system energy requirements and system efficiencies of heating systems in buildings. In particular this European Standard is one of a number of standards dealing with domestic hot water systems.

The scope of this specific part is to standardise the methods for determining the energy needs for domestic hot water. This European Standard covers the domestic hot water needs in buildings.

The calculation of the energy needs for domestic hot water applies to a dwelling, a building or a zone of a building.

In order to be coherent with calculation methods for space heating systems, emission losses representing taps and control should be taken into account.

#### 2 Normative references

Not applicable.

## 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

# 3.1 auxiliary energy

(standards.iteh.ai)

electrical energy used by technical building systems for heating, cooling, ventilation and/or domestic hot water to support energy transformation to satisfy energy needs to support energy transformation to satisfy energy needs to support energy transformation to satisfy energy needs to support energy transformation to satisfy energy needs.

NOTE 1 This includes energy for fans, pumps, electronics etc. Electrical energy input to a ventilation system for air transport and heat recovery is not considered as auxiliary energy, but as energy use for ventilation.

NOTE 2 In EN ISO 9488, the energy used for pumps and valves is called "parasitic energy".

# 3.2

#### building

construction as a whole, including its envelope and all technical building systems, for which energy is used to condition the indoor climate, to provide domestic hot water and illumination and other services related to the use of the building

NOTE The term can refer to the building as a whole or to parts thereof that have been designed or altered to be used separately.

#### 3.3

#### building services

services provided by technical building systems and by appliances to provide indoor climate conditions, domestic hot water, illumination levels and other services related to the use of the building

#### 3.4

## calculated energy rating

energy rating based on calculations of the weighted delivered and exported energy of a building for heating, cooling, ventilation, domestic hot water and lighting

NOTE National bodies decide whether other energy uses resulting from occupants' activities such as cooking, production, laundering etc. are included or not. If included, standard input data shall be provided for the various types of building and uses. Lighting is always included except (by decision of national bodies) for residential buildings.

#### 3.5

#### calculation period

period of time over which the calculation is performed

NOTE The calculation period can be divided into a number of calculation steps.

#### 3.6

#### cold water supply temperature

water temperature of the cold water distribution network

#### 3.7

#### domestic hot water heating

process of heat supply to raise the temperature of the cold water to the intended delivery temperature

#### 3.8

#### domestic hot water delivery temperature

temperature of the domestic hot water at the delivery point

#### 3.9

#### energy need for domestic hot water

heat to be delivered to the needed amount of domestic hot water to raise its temperature from the cold network temperature to the prefixed delivery temperature at the delivery point, not taking into account the technical building thermal systems

#### 3.10

#### energy use for space heating or cooling or domestic hot water VIII W

energy input to the space heating or cooling system or the domestic hot water system to satisfy the energy need for space heating or cooling (including dehumidification) or domestic hot water, respectively

NOTE If the technical building system serves several purposes (e.g. space heating and domestic hot water), it can be difficult to split the energy use into that used for each purpose 200 and be indicated as a combined quantity (e.g. energy need for space heating and domestic not water) log/standards/sist/1b8df958-000e-4068-82a9-

745b738611e5/sist-en-15316-3-1-2007

#### 3.11

## energy performance of a building

calculated or measured amount of energy delivered and exported actually used or estimated to meet the different needs associated with a standardised use of the building, which may include, inter alia, energy used for heating, cooling, ventilation, domestic hot water and lighting

#### 3.12

#### energy rating

evaluation of the energy performance of a building based on the weighted sum of the calculated or measured use of energy carriers

#### 3.13

# heating or cooling season

period of the year during which a significant amount of energy for heating or cooling is needed

NOTE The season lengths are used to determine the operation period of technical systems.

#### 3.14

## heat recovery

heat generated by a technical building system or linked to a building use (e.g. domestic hot water) which is utilised directly in the related system to lower the heat input and which would otherwise be wasted (e.g. preheating of the combustion air by flue gas heat exchanger)

#### 3.15

#### power shower

shower having an associated pump to increase the water flow rate and pressure

#### 3.16

#### recoverable system thermal loss

part of a system thermal loss which can be recovered to lower either the energy need for heating or cooling or the energy use of the heating or cooling system

NOTE This depends on the calculation approach chosen to calculate the recovered gains and losses (holistic or simplified approach).

#### 3.17

#### recovered system thermal loss

part of the recoverable system thermal loss which has been recovered to lower either the energy need for heating or cooling or the energy use of the heating or cooling system

#### 3.18

#### system boundary

boundary that includes within it all areas associated with the building (both inside and outside the building) where energy is consumed or produced

NOTE Inside the system boundary, the system losses are taken into account explicitly, outside the system boundary they are taken into account by the conversion factor.

#### 3.19

#### system thermal loss

thermal loss from a technical building system for heating, cooling, domestic hot water, humidification, dehumidification, or ventilation or lighting that does not contribute to the useful output of the system

- NOTE 1 A system loss can become an internal heat gain for the building, if it is recoverable.
- NOTE 2 Thermal energy recovered directly in the subsystem is not considered as a system thermal loss but as heat recovery and directly treated in the related system standard.

SIST EN 15316-3-1:2007

NOTE 3 Heat dissipated by the lighting system or by other services (e.g. appliances of computer equipment) is not part of the system thermal losses, but part of the internal heat gains.

#### 3.20

#### tapping program

24-hour cycle that defines a number of domestic hot water draw-off requirements: succession of energy needs corresponding to uses of domestic hot water during a day

### 3.21

#### technical building system

technical equipment for heating, cooling, ventilation, domestic hot water, lighting and electricity production composed by sub-systems

- NOTE 1 A technical building system can refer to one or to several building services (e.g. heating system, space heating and domestic hot water system).
- NOTE 2 Electricity production can include cogeneration and photovoltaic systems.

#### 3.22

#### technical building sub-system

part of a technical building system that performs a specific function (e.g. heat generation, heat distribution, heat emission)

# 4 Symbols, units and indices

For the purposes of this document, the following symbols and units (Table 1) and indices (Table 2) apply:

Table 1 — Symbols and units

Symbol	Name of quantity	Unit
Α	area	m <sup>2</sup>
С	specific heat capacity	J/(kg K)
f	conversion factor	-
N	number of operating times	-
Q	quantity of heat, energy	J
V	volume	m <sup>3</sup>
x, y, z	constants	-
η	efficiency	-
θ	celsius temperature	°C

Table 2 — Indices

https://standards.iteh.ai/catalog/standards/sist/1b8df958-000e-4068-82a9-745b738611e5/sist-en-15316-3-1-2007

# 5 Methods for calculation of energy needs for domestic hot water for different installations

#### 5.1 General

Four methods for calculation of the energy needs for the delivered domestic hot water are described. The methods differ as to the level of detail assumed for the domestic hot water demand; for example whether the conditions relating to the different uses of the domestic hot water are taken into account.

A national annex may specify which method should be used for different building types. A national annex may also specify which method is applicable for the purpose of energy labelling or any other specific use.

The calculations are based on a daily domestic hot water requirement.

# 5.2 Energy needs for domestic hot water based on tapping programs

This method is characterised by the use of one or more 24-hour cycles that define a number of domestic hot water draw-off requirements.

Tapping programs may be given in a national annex and shall identify the building type(s) for which they can be used. The tapping programs shall include the energy content of each draw-off, the corresponding delivery temperature and the appropriate flow rate.

For single-family dwellings, the tapping programs detailed in EN 13203-2 should be used. These are given in Annex A. Reference should be made to EN 13203-2 for a full explanation of these tapping programs.
