### Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 8686-3 was prepared by Technical Committee ISO/TC 96, *Cranes*, Subcommittee SC 7, *Tower cranes*.

ISO 8686 consists of the following parts, under the general title Cranes Design principles for load and load combinations:

— Part 1: General

# (standards.iteh.ai)

— Part 2: Mobile cranes

ISO 8686-3:1998 https://standards.iteh.ai/catalog/standards/sist/9e375dac-17f4-49c2-a112-701562c35d4e/iso-8686-3-1998

- Part 3: Tower cranes
- Part 4: Jib cranes
- Part 5: Overhead travelling cranes and portal bridge cranes

# iTeh STANDARD PREVIEW (standards.iteh.ai)

### Cranes — Design principles for loads and load combinations — Part 3: Tower cranes

1 Scope

This part of ISO 8686 establishes the application of ISO 8686-1 for tower cranes, as defined in ISO 4306-3, and gives specific values for factors to be used.

#### 2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 8686. At the time of the publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 8686 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards. (standards.

ISO 12485:—<sup>1)</sup>, Cranes — Stability requirements of tower cranes.

#### **3 Definitions**

For the purposes of this part of ISO 8686, the definitions given in ISO 8686-1 apply.

#### 4 Symbols and abbreviated terms

The symbols used are described in ISO 8686-1:1989, table 1.

<sup>&</sup>lt;sup>1)</sup> To be published.

#### 5 General

The proof of competence of components shall be determined by either the limit state method or the allowable stress method as set out in ISO 8686-1.

Tower cranes which are subject to tipping and drifting shall be designed in accordance with ISO 12485.

#### 6 Loads and applicable factors

Table 1 specifies factors  $\Phi_n$  for dynamic effects which are used for load combinations listed in table 2, and also makes reference to ISO 8686-1 and other relevant International Standards.

The line numbers listed in the first column of table 1 are those shown in column 3 of table 2.

For those parts of the crane whose masses significantly decrease the resulting load effects and which have to be considered as "favourable", reduced partial load factors shall be applied.

Where the masses and their centres of gravity are determined by experiment (weighing), the factors in accordance with favourable effects 1.2.1 of table 2, line 1, shall be used.

Where the masses and their centres of gravity are calculated based on final piece lists, the factors in accordance with favourable effects 1.2.2 of table 2, line 1, shall be used.

## iTeh STANDARD PREVIEW (standards.iteh.ai)

<u>ISO 8686-3:1998</u> https://standards.iteh.ai/catalog/standards/sist/9e375dac-17f4-49c2-a112-701562c35d4e/iso-8686-3-1998

Line No. in table 2	Factor $\Phi_n$	Clause references in ISO 8686-1	Guidance on values of factors $\Phi_n$ and load factors References to other International Standards
1	$\Phi_1$	6.1.1	$\Phi_1 = 1 \pm a \qquad a = 0,1$
			$\Phi_1$ = 1 for design against tipping
2	$\Phi_2$	6.1.2.2	Hoisting class HC 1 with a mininum value of 1,05
	$\Phi_3$	6.1.2.3	
3	$\Phi_4$	6.1.3.2	$\Phi_4$ = 1,1 is recommended for building site cranes — Other values may be used when the rail tracks tolerances (as agreed between user and manufacturer) vary from standard
			When using rigid body kinetic models:
4		6.1.4	$\Phi_5$ = 1,2 if the acceleration or braking forces are changed with stepless control systems without backlash
and 5	$\Phi_5$	and annex D	$\varPhi_5$ = 1,5 in other control systems where drive forces are acting on the crane practically free of backlash
5			$\Phi_5$ = 2 where considerable backlash exists
			Other values for $arPhi_5$ may be used when substantiated
6		itesh ST	Partial load factors shall be considered where appropriate
7		6.2.1.1 <b>(st</b>	In-service wind in accordance with ISO 4302
8		6.2.1.2	Snow and ice loads need only be considered in special cases and then in accordance with regional conditions
9		https://standards.iteh.ai 6.2.1.3 70	Loads due to temperature variations need only be considered where appropriate according to regional and local conditions
10		6.2.2	Loads caused by skewing are negligible when using common undercarriages, otherwise requirements of ISO 8686-1:1989, annex F apply
11	$\Phi_2$	6.1.2.2.2	Hoisting class HC 1
12		6.3.1	Regional out-of-service wind load-conditions in accordance with ISO 4302
13	$\Phi_6$	6.3.2	Static test load = $1,25 \times$ (Net load carried out in accordance with ISO 4310)
			Dynamic test load $\Phi_6 = 0.5 \times (1 + \Phi_2)$
14	$\Phi_7$	6.3.3	Buffer forces need not be considered where the travelling velocity at contact with the buffer or end stop is less than 0,7 m/s
15		6.3.4	Tilting forces shall not be considered
16	$\Phi_5$	6.3.5	Loads caused by emergency cut-out shall have a maximum value of the factor $\varPhi_{\rm 5}$
17		6.3.6	Load caused by failure of mechanism or components shall be considered where appropriate
18		6.3.7	Excitation effects shall be considered where appropriate

#### 7 Load combinations — General design

#### 7.1 Inertia forces

The inertia forces acting on the crane structure during acceleration and deceleration shall be determined from the maximum driving forces arising in regular operations and combined as follows.

When there is no restriction to operated different movements simultaneously: a)

Hoist movement combined with either

slewing and crab traversing

or slewing and luffing

or slewing and crane travelling.

The inertia forces during slewing and deceleration shall be combined with centrifugal forces.

For centrifugal forces,  $\Phi_5 = 1$ .

When there are restrictions to operate different movements simultaneously, the inertia forces shall be combined b) so they can act simultaneously.

#### 7.2 Wind load in operation

TANDARD PREVIEW The wind pressure should be limited to the following values

During erection 0,125 kN/m<sup>2</sup>

In-service

ISO 8686-3:1998

0,25 kN/m<sup>2</sup> ds.iteh.ai/catalog/standards/sist/9e375dac-17f4-49c2-a112-

These values are recommended for design purposes, but instructions in operator's manuals may limit the actual work to maximum wind speeds that imply lower values.

standards.iteh.ai)

#### 8 Load combinations on site

For tower cranes on site, the safety analysis is sufficient for the load combinations A1, A2, A3, A4, B1, B2, B3, B4, C1, C2, C3 in accordance with table 2.
