- Teil 1-1: Allgemeines - Allgemeine Regeln und Regeln für den Hochbau

This draft amendment is submitted to CEN members for unique acceptance procedure. It has been drawn up by the Technical Committee CEN/TC 250.

This draft amendment A1, if approved, will modify the European Standard EN 1995-1-1:2004. If this draft becomes an amendment, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for inclusion of this amendment into the relevant national standard without any alteration.

This draft amendment was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

#### **Draft Amendment No. 1 to EN 1995-1-1:2004**

#### 8.7.2 Axially loaded screws

- (1) The following failure modes should be verified when assessing the load-carrying capacity of connections with axially loaded screws:
- the withdrawal capacity of the threaded part of the screw;
- for screws used in combination with steel plates, the tear-off capacity of the screw head should be greater than the tensile strength of the screw;
- the pull-through strength of the screw head;
- the tension strength of the screw;
- for screws used in conjunction with steel plates, failure along the circumference of a group of screws (block shear or plug shear);
- (2) Minimum spacing and edge distances for axially loaded screws should be taken from Table 8.6.

Table 8.6 - Minimum spacings and edge distances for axially loaded screws

Screws driven	Minimum spacing	Minimum edge distance
At right angle to the grain	DA Ad P	REV <sup>4</sup> d FW
In end grain	ard4d itel	2,5d

- (3) The minimum pointside penetration length of the threaded part should be 6d.
- (4) The characteristic withdrawal capacity of connections with axially loaded screws should be taken as:

$$F_{\text{ax},\alpha,Rk} = n_{\text{ef}} \left(\frac{8 d}{l_{\text{ef}}}\right)^{0.2} f_{\text{ax},\alpha,k} \ d \ l_{\text{ef}}$$
 (8.38)

where:

 $F_{\text{ax},\alpha,Rk}$  is the characteristic withdrawal capacity of the connection at an angle  $\alpha$  to the grain;

 $n_{\rm ef}$  is the effective number of screws;

d is the outer diameter measured on the threaded part;

 $l_{\rm ef}$  is the pointside penetration length of the threaded part minus one screw diameter;

 $f_{\mathrm{ax},\alpha,\mathbf{k}}$  is the characteristic withdrawal strength at an angle  $\alpha$  to the grain.

(5) The characteristic withdrawal strength at an angle  $\alpha$  to the grain should be taken as:

$$f_{\text{ax},\alpha,k} = \frac{f_{\text{ax},k}}{\sin^2 \alpha + 1.5 \cos^2 \alpha} \tag{8.39}$$

where the characteristic withdrawal strength perpendicular to the grain,  $f_{ax,k}$  in N/mm<sup>2</sup>, should be determined either by testing in accordance with EN 1382 and EN 14358 or calculated from the following expression:

$$f_{\rm ax,k} = 0.037 \rho_{\rm k}$$
 (8.40)

where:

 $f_{ax,k}$  is the characteristic withdrawal strength perpendicular to the grain;
