iTeh STANDARD PREVIEW (standards.iteh.ai)

ISO/IEC 8327-1:1996

<https://standards.iteh.ai/catalog/standards/sist/b81fa4c5-b93b-4889-a898-f8b0ed6b073a/iso-iec-8327-1-1996>

Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

International Standard ISO/IEC 8327-1 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 21, *Open Systems Interconnection, data management and open distributed processing*, in collaboration with ITU-T. The identical text is published as ITU-T Recommendation X.225.

ISO/IEC 8327-1:1996

This second edition cancels and replaces the first edition (ISO 8327:1987), which has been technically revised. It also incorporates Amendment 3:1992. 1-1996

ISO/IEC 8327 consists of the following parts, under the general title *Information technology — Open Systems Interconnection — Connection-oriented Session protocol*:

- *Part 1: Protocol specification*
- *Part 2: Protocol Implementation Conformance Statement (PICS) proforma*

Annexes A to C form an integral part of this part of ISO/IEC 8327. Annex D is for information only.

Introduction

This Recommendation | International Standard is one of a set of Recommendations | International Standards produced to facilitate the interconnection of computer systems. The set of Recommendations | International Standards covers the services and protocols required to achieve such interconnection.

This Recommendation | International Standard is positioned with respect to other related Recommendations | International Standards by the layers defined in the Reference Model for Open Systems Interconnection (see ITU-T Rec. X.200 | ISO/IEC 7498-1). It is most closely related to and lies within the field of application of the Session Service Definition (see ITU-T Rec. X.215 | ISO/IEC 8326). It also uses and references the Transport Service Definition (see ITU-T Rec. X.214 | ISO/IEC 8072), whose provisions it assumes in order to accomplish the aims of the session protocol. The interrelationship of these Recommendations | International Standards is depicted in Figure Intro. 1.

This Recommendation | International Standard specifies a single protocol with a common encoding.

It is intended that the session protocol should be general enough to cater for the total range of session service users without restricting future extensions.

The protocol is structured so that subsets of protocol can be defined.

The primary aim of this Recommendations | International Standards is to provide a set of rules for communication expressed in terms of the procedures to be carried out by peer session entities at the time of communication. These rules for communication are intended to provide a sound basis for development in order to serve a variety of purposes:

- a) as a guide for implementors and designers;
- b) for use in the testing and procurement of equipment;
- c) as a part of an agreement for the admittance of systems into the open systems environment;
- d) as a refinement to the understanding of OSI.

It is expected that the initial users of this Recommendation | International Standard will be designers and implementors of equipment and the Recommendation | International Standard contains, in Notes or in annexes, guidance on the implementation of the procedures defined in this Recommendation | International Standard.

It should be noted that, as the number of valid protocol sequences is very large, it is not possible with current technology to verify that an implementation will operate the protocol defined in this Recommendation | International Standard correctly under all circumstances. It is possible by means of testing to establish confidence that an implementation correctly operates the protocol in a representative sample of circumstances. It is, however, intended that this Recommendation | International Standard can be used in circumstances where two implementations fail to communicate in order to determine whether one or both have failed to operate the protocol correctly.

The variations and options available within this Recommendation | International Standard are essential as they enable a session service to be provided for a wide variety of applications. Thus, a minimally conforming implementation will not be suitable for use in all possible circumstances. It is important, therefore, to qualify all references to this Recommendation | International Standard with statements of the options provided or required or with statements of the intended purpose of provision or use.

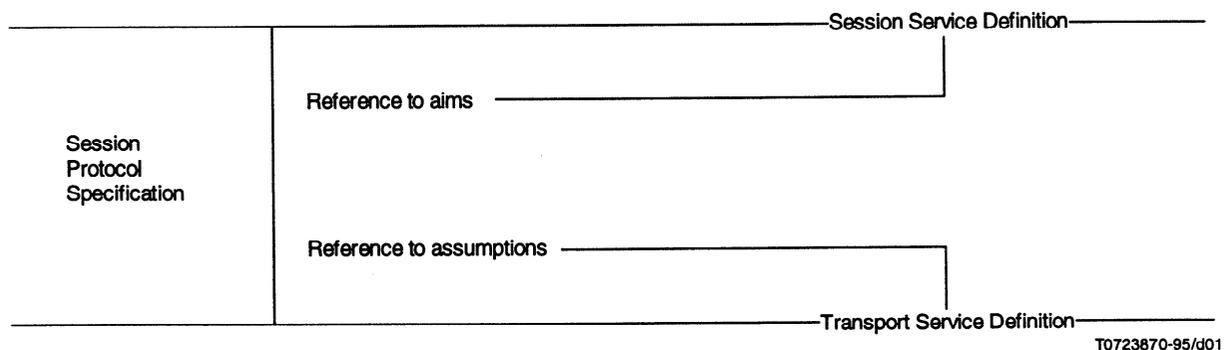

Figure Intro. 1 – Relationship between the connectionless session protocol and adjacent services

INTERNATIONAL STANDARD

ITU-T RECOMMENDATION

**INFORMATION TECHNOLOGY – OPEN SYSTEMS INTERCONNECTION –
CONNECTION-ORIENTED SESSION PROTOCOL: PROTOCOL SPECIFICATION**

SECTION 1 – GENERAL

1 Scope

This Recommendation | International Standard specifies:

- a) procedures for a single protocol for the transfer of data and control information from one session entity to a peer session entity;
- b) the means of selecting the functional units to be used by the session entities;
- c) the structure and encoding of the session protocol data units used for the transfer of data and control information;

The procedures are defined in terms of:

- a) the interactions between peer session entities through the exchange of session protocol data units;
- b) the interactions between a session entity and the session service user in the same system through the exchange of session service primitives;
- c) the interactions between a session entity and the transport service provider through the exchange of transport service primitives.

These procedures are applicable to instances of communication between systems which support the session layer of the OSI Reference Model and which wish to interconnect in an open systems environment.

This Recommendation | International Standard also specifies conformance requirements for systems implementing these procedures. It does not contain tests which can be used to demonstrate this conformance.

The text pertaining to the symmetric synchronization functional unit is not applicable to the support of ITU-T applications.

2 Normative references

The following Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and International Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and International Standards listed below. Members of ISO and IEC maintain registers of currently valid International Standards. The Telecommunication Standardization Bureau of the ITU maintains a list of currently valid ITU-T Recommendations.

2.1 Identical Recommendations | International Standards

- ITU-T Recommendation X.200 (1994) | ISO/IEC 7498-1:1994, *Information technology – Open Systems Interconnection – Basic Reference Model: The Basic Model*.
- ITU-T Recommendation X.214 (1993) | ISO/IEC 8072:1994, *Information technology – Open Systems Interconnection – Transport service definition*.

- ITU-T Recommendation X.215 (1995) | ISO/IEC 8326:1996, *Information technology – Open Systems Interconnection – Session service definition*.
- ITU-T Recommendation X.245 (1995) | ISO/IEC 8327-2:¹⁾, *Information technology – Open Systems Interconnection – Connection-oriented Session protocol: Protocol Implementation Conformance Statement (PICS) proforma*.

2.2 Paired Recommendations | International Standards equivalent in technical content

- CCITT Recommendation X.290 (1992), *OSI conformance testing methodology and framework for protocol Recommendations for CCITT applications – General concepts*.
ISO/IEC 9646-1:1994, *Information technology – Open Systems Interconnection – Conformance testing methodology and framework – Part 1: General concepts*.
- CCITT Recommendation X.291 (1992), *OSI conformance testing methodology and framework for protocol Recommendations for CCITT applications – Abstract test suite specification*.
ISO/IEC 9646-2:1994, *Information technology – Open Systems Interconnection – Conformance testing methodology and framework – Part 2: Abstract Test Suite specification*.

2.3 Additional References

- ITU-T Recommendation T.62 (1993), *Control procedures for teletex and Group 4 facsimile services*.

NOTE – ITU-T Recommendation T.62 is not essential for the application of this Recommendation | International Standard, but is included in the list of references as it has been referred to, for information, in relation to interworking with the ITU-T Telematic services (see Annexes B and C).

3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply.

NOTE – The definitions contained in this clause make use of abbreviations defined in clause 4.

3.1 This Recommendation | International Standard is based on the concepts developed in ITU-T Rec. X.200 | ISO 7498-1, and makes use of the following terms defined in it:

- a) expedited session service data unit;
- b) session connection;
- c) Session Layer;
- d) session protocol data unit;
- e) session service;
- f) session service access point;
- g) session service data unit;
- h) Transport Layer;
- i) transport connection;
- j) transport service;
- k) transport service access point;
- l) concatenation;
- m) segmenting.

3.2 This Recommendation | International Standard is also based on concepts developed in ITU-T Rec. X.215 | ISO/IEC 8326 and makes use of the following terms defined in it:

- a) token;
- b) calling SS-user;
- c) called SS-user;
- d) sending SS-user;

¹⁾ To be published.

- e) receiving SS-user;
- f) requesting SS-user;
- g) accepting SS-user;
- h) requestor;
- i) acceptor.

NOTE – The following terms used in this Recommendation | International Standard are used in relation to tokens and are explained in ITU-T Rec. X.215 | ISO/IEC 8326:

- a) assigned;
- b) not assigned;
- c) available;
- d) not available.

3.3 This Recommendation | International Standard also uses concepts developed in CCITT Rec. X.290 | ISO/IEC 9646-1 and makes use of the following terms defined in it:

- a) Protocol Implementation Conformance Statement (PICS);
- b) PICS proforma.

3.4 Session protocol definitions

3.4.1 Session Protocol Machine (SPM): An abstract machine that carries out the procedures specified in this protocol.

NOTE – A session entity is comprised of one or more SPMs.

3.4.2 session service user (SS-user): An abstract representation of the totality of those entities within a single system that make use of the Session Service.

3.4.3 transport service provider (TS-provider): An abstract machine which models the totality of the entities providing the transport service, as viewed by a session entity.

3.4.4 local matter: A decision made by a system concerning its behaviour in the Session Layer that is not subject to the requirements of this protocol.

3.4.5 initiator: An SPM that initiates a CONNECT SPDU.

3.4.6 responder: An SPM with whom an initiator wishes to establish a session connection.

NOTE – Initiator and responder are defined with respect to a single session connection.

3.4.7 sending SPM: An SPM that sends a given SPDU.

3.4.8 receiving SPM: An SPM that receives a given SPDU.

3.4.9 owner (of a token): The SPM to whom a token is assigned.

3.4.10 proposed parameter: The value for a parameter proposed by an SPM in a CONNECT SPDU or an ACCEPT SPDU that it wishes to use on the session connection.

3.4.11 negotiation: The process by which two SPMs agree on a common set of functional units and protocol values and on the initial setting of available tokens.

3.4.12 selected parameter: The value for a parameter that has been chosen for use on the session connection.

3.4.13 valid SPDU: An SPDU which complies with the requirements of ITU-T Rec. X.225 | ISO/IEC 8327-1 with respect to structure and encoding.

3.4.14 invalid SPDU: An SPDU which does not comply with the requirements of ITU-T Rec. X.225 | ISO/IEC 8327-1 with respect to structure and encoding.

- 3.4.15 protocol error:** Use of an SPDU that does not comply with the procedures agreed for the session connection.
- 3.4.16 transparent (data):** SS-user data which is transferred intact between SPMs and which is unavailable for use by the SPMs.
- 3.4.17 SPDU identifier (SI):** Heading information that identifies the SPDU concerned.
- 3.4.18 length indicator (LI):** An indicator that represents the length of an associated parameter field.
- 3.4.19 parameter field:** A group of one or more octets used to represent a particular set of information.
- 3.4.20 parameter identifier (PI):** An identifier, defined in ITU-T Rec. X.225 | ISO/IEC 8327-1, that indicates the type of information contained in its associated parameter field.
- 3.4.21 PI unit:** An element of an SPDU that contains a PI field together with its associated LI field and parameter field.
- 3.4.22 parameter group identifier (PGI):** An identifier, defined in ITU-T Rec. X.225 | ISO/IEC 8327-1, that indicates the type of information contained in its associated parameter field. The associated parameter field may consist of a set of PI units.
- 3.4.23 PGI unit:** An element of an SPDU that contains a PGI field together with its associated LI field and parameter field.
- 3.4.24 parameter value (PV):** Information that represents the value of the parameter identified by either a PI or PGI.
- 3.4.25 local variable:** A local variable within the SPM which is used as a means of clarifying the effects of certain actions and clarifying the conditions under which certain actions are permitted.

4 Abbreviations

iTeh STANDARD PREVIEW

(standards.iteh.ai)

For the purposes of this Recommendation | International Standard, the following abbreviations apply.

4.1 Data units

ISO/IEC 8327-1:1996

SPDU	session-protocol-data-unit
SSDU	session-service-data-unit
TSDU	transport-service-data-unit

4.2 SPDU fields

SI	SPDU identifier (see 3.4.17)
LI	Length indicator (see 3.4.18)
PI	Parameter identifier (see 3.4.20)
PGI	Parameter group identifier (see 3.4.22)
PV	Parameter value (see 3.4.24)

4.3 Timer variables

TIM	Disconnection and abort timer
-----	-------------------------------

4.4 Miscellaneous

PICS	Protocol Implementation Conformance Statement
SPM	Session Protocol Machine (see 3.4.1)
SS	session-service
SSAP	session-service-access-point
TSAP	transport-service-access-point

4.5 Local variables

Vact	See 5.9.1
Vnextact	See 5.9.2
V(A)	See 5.9.3.1
V(M)	See 5.9.3.2
V(R)	See 5.9.3.3
Vsc	See 5.9.3.4 and 5.9.4.4
V(Ado)	See 5.9.3.5
V(Adi)	See 5.9.3.6
V(As), V(Ar)	See 5.9.4.1
V(Ms), V(Mr)	See 5.9.4.2
V(Rs), V(Rr)	See 5.9.4.3

5 Overview of the session protocol

5.1 Model of the session layer

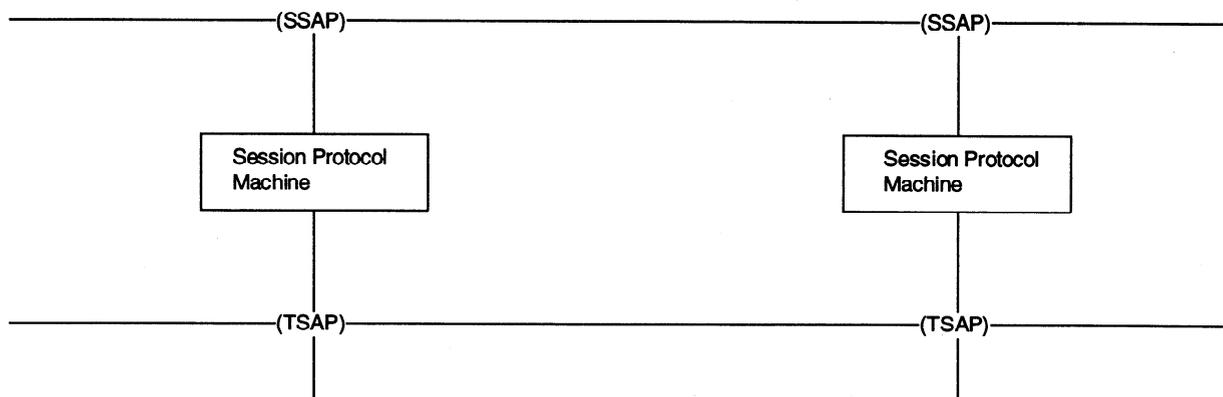

The SPM (see the Note) within the session layer communicates with the SS-user through an SSAP by means of the service primitives as defined by the session service definition ITU-T Rec. X.215 | ISO/IEC 8326. Service primitives will cause or be the result of session protocol data unit exchanges between the peer SPMs using a transport connection. These protocol exchanges are effected using the services of the transport layer as defined by the transport service definition ITU-T Rec. X.214 | ISO/IEC 8072 through two TSAPs.

<https://standards.iteh.ai/catalog/standards/sist/b81fa4c5-b93b-4889-a898-800c00e57130/iso-8327-1-1996>

Session connection endpoints are identified in end systems by an internal, implementation dependent, mechanism so that the SS-user and the SPM can refer to each session connection.

The model of the session layer is illustrated in Figure 1.

NOTE – A session entity is comprised of one or more SPMs.
