## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 15642 was prepared by Technical Committee ISO/TC 195, *Building construction machinery and equipment*.

<https://standards.iteh.ai/catalog/standards/sist/07baacac-0d1b-4a7a-96cb-4ef957719a93/iso-15642-2003>

## Introduction

This International Standard deals with asphalt mixing plants used in road construction and maintenance processes.

It provides definitions of equipment, processed materials, parameters and activities involved in asphalt manufacturing and technical characteristics of machinery as well. The performance of asphalt mixing plants and their components is shown.

# Road construction and maintenance equipment — Asphalt mixing plants — Terminology and commercial specifications

## 1 Scope

This International Standard establishes the terminology, gives requirements for specifications, and lists characteristics useful for determining theoretical performances and drafting technical documents for asphalt mixing plants used in the construction and maintenance of

- motorway, road and airport pavements, and
- road system and networks.

It does not specify safety conditions, which are covered by specific standards. Equipment relating to quality control of manufactured products is defined by the standards specific to these products.

This International Standard is applicable to fixed plants during production time, whether they are transferable or not, which excludes mobile equipment for soil stabilization or retreading.

This International Standard is applicable to mixing and/or coating plants for materials treated with hydrocarbon binders

- for continuous production (see Figure A.1), and
- for batch production (see Figure A.2).

## 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 536, *Road construction machines — Asphalt mixing plants — Safety requirements*

## 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

### 3.1

#### **asphalt mix**

⟨mixed material⟩ homogeneous paving product consisting of sized mineral aggregates, possibly including additives and filler, collectively and uniformly coated with binder

### 3.2

#### **asphalt mixing plant**

set of equipment for asphalt mix production

### 3.3

#### **batch**

unit volume of material consisting of aggregates, binder, fines, possibly additives, contained and processed simultaneously in a batch-type mixer

### 3.4

#### **batch plant**

asphalt mixing plant in which the operations to prepare the material and mixing are undertaken by successive batches in a mixer which interrupts the material flow

See Figure A.5.

### 3.5

#### **continuous plant**

asphalt mixing plant in which the operations to prepare the material and the mixing are undertaken by continuous equipment and handling systems and in a mixer which does not interrupt the material flow

See Figure A.3.

### 3.6

#### **output of a plant**

quantity of material produced based on 1 h of stabilized operation, expressed in metric tons

NOTE The conventional output is expressed by referring to parameters recommended in Clause 5.

### 3.7

#### **batch cycle**

minimum duration, expressed in seconds, between corresponding operations of successive batches

### 3.8

#### **reclaimed fines**

small particles of aggregate, transported by the gases in the drums where the aggregates are dried and which are captured by the dust collectors

See Figure A.14.

### 3.9

#### **imported filler**

small particles of material other than sand or reclaimed fines and used as an ingredient of asphalt mix

### 3.10

#### **residual water**

water contained in the aggregate after drying

NOTE The residual water content is expressed as a percentage of the dry aggregate mass.

### 3.11

#### **container**

any type of bin, hopper box or tank capable of holding of constituent materials

### 3.12

#### **continuous-volume dosing unit**

device for proportioning the constituents in which the flow is determined by the opening height of a gate and/or the belt speed

NOTE A special device may be used to permanently check the presence of ingredients on the belt.

**3.13****continuous-mass dosing unit**

device for proportioning the constituents in which the mass flow is obtained by the belt speed multiplied by the mass of constituent materials spread over 1 m of the belt or measuring system of the screw feeder

See Figure A.7 c).

**3.14****batch-mass dosing unit**

device for proportioning in cycles the constituent materials in which the quantity delivered is determined by a weighing apparatus

See Figure A.7 a) and b).

**3.15****last runnings**

that quantity of ingredients delivered by the feeder but not yet measured by the weighing instrument

**3.16****screening device**

equipment used to classify and separate material particles by sizes passing through the grate openings

See Figure A.9.

**3.17****circulation of gases**

heated air flow providing transfer of heat to, and moisture from, material in a dryer

NOTE The respective directions of air flow and material flow in a dryer are said to be

— parallel-flow if they progress in the same direction (see Figure A.11), and

— counter-flow if they progress in opposite directions (see Figure A.12).

**3.18****drum dryer**

equipment used to dry and heat aggregates

See Figure A.8.

**3.19****RAP drum dryer**

equipment used to dry and heat reclaimed asphalt pavements (RAP)

**3.20****drum dryer-mixer**

combination drum dryer and mixer used to dry and heat aggregates, possibly including additives and fillers, and subsequently mixing them with binder to produce asphalt mix

See Figures A.12 and A.13.

**3.21****drum dryer-mixer with recycling capability**

drum dryer-mixer having the ability to include RAP in the mixing process of asphalt mix production

**3.22****mixer****pug mill**

equipment used to homogenize and evenly coat constituent materials with additives or binder using a set of tools to agitate and displace the material bed

See Figures A.4 and A.10.

**3.23**

**dry mixing time<sup>1)</sup>**

duration from introduction of dry constituents until introduction of liquid constituents

**3.24**

**wet mixing time**

duration from introduction of liquid constituent until material begins to leave the mixing region

**3.25**

**total mixing time<sup>1)</sup>**

sum total of dry mixing time and wet mixing time

**3.26**

**dwelt time**

duration material remains in a mixer

**3.27**

**anti-segregation hopper**

container receiving the material when there is a change of movement in the material in order to reduce the dynamic effect which might cause segregation

NOTE The hoppers are generally arranged at the output of the mixers, the dryer-mixer drums and the conveyors.

**3.28**

**batching accuracy**

relative deviation of the batched portion from the programmed value, expressed as a percent

NOTE Batching accuracy is expressed by the formula

$$\frac{m_a - m}{m} \times 100 \%$$

where

$m$  is the specified mass for batching;

$m_a$  is the real value of a mass received in a batching process.

STANDARD PREVIEW

## **4 Descriptions of coating and/or mixing plants**

### **4.1 Functions of the plant**

The plant shall be capable of ensuring the following:

- storage and charging of aggregates;
- measuring out of aggregates;
- drying and heating of aggregates at a preset temperature;
- removal of dust from the gases emitted from the dryer;
- processing of gases from drying and heating so as to recover the fines, and secondly, limit the atmospheric pollution (see Figure A.14);
- re-introduction of reclaimed fines (if available);

---

1) Refers to asphalt mixing plants for batch production.

- storage and measuring out of hot binders;
- measuring out of hot aggregates;
- mixing of constituents to obtain a homogeneous and uniformly coated product;
- handling and storage of mixed materials (see Figure A.15);
- storage of fuels for heater used for heating the binder tanks and installations.

These functions may be ensured by plants operating continuously or using a batch system.

## 4.2 Components of asphalt mixing plants

Asphalt mixing plants may consist of the following components (see Figures A.1 to A.3):

- cold feed bins;
- dosing units for measuring out aggregates, situated underneath the bin outlets;
- conveyor for moving aggregates to a dryer;
- vibrating screen<sup>2)</sup>;
- aggregate dosing unit<sup>2)</sup>;
- dryer or dryer-mixer;
- dust collector;
- installation for re-introduction of reclaimed fines to the aggregates leaving dryer (if available);
- filler silo with feeder<sup>2)</sup> or dosing unit<sup>2)</sup>;
- elevator for moving aggregates to a feed bin or vibrating screen<sup>1)</sup>;
- binder tank;
- fuel (oil) tanks and installation for heating of binder tank and dryer's burner supply;
- vibrating screen;
- hot aggregate storage bins<sup>1)</sup>;
- aggregate weighing unit<sup>1)</sup>;
- binder weighing unit<sup>1)</sup>;
- filler weighing unit<sup>1)</sup>;
- batch mixer<sup>1)</sup>;
- skip or drag slat conveyor for mixed material handling;
- mixed material holding or storage bin(s);
- feed bin<sup>2)</sup>;
- binder dosing unit<sup>2)</sup>;
- continuous mixer<sup>2)</sup>;
- batcher;
- control station.

---

2) Refers to asphalt mixing plants for continuous production.

### 4.3 Additional equipment

The coating and/or mixing plants for materials treated with hot hydrocarbon binders may be completed by equipment to recycle reclaimed asphalt pavements (RAP) (see Figure A.12).

They shall ensure

- handling and batching of RAP, and
- drying and heating of these RAPs.

This equipment may be:

- installed near the coating plant; in this case, the dried and heated RAP are re-inserted at a specific point in the production cycle;
- installed as a complement to a coating plant in continuous production; in this case, the cold RAP proportioned by mass, shall be introduced in a specific zone of the rotary drum by means of a special device for charging recycled products (see Figure A.11); or
- an RAP drum with hot air circulation, installed near to an aggregate dryer drum.

The RAP and the new heated aggregates are put together on leaving their respective drums and processed in a continuous mixer. Each of the aggregates has previously been continuously fed either by volume or by mass.

### 4.4 Mastic asphalt production plants

These are of the same design as batch production plants, but they are particularly characterized by the fact that the materials are processed at higher temperatures (up to 250 °C).

### 4.5 Control of plant operation

#### 4.5.1 Types of the control plant operational control

The following types of operation are possible:

- automatic;
- semi-automatic;
- manual.

#### 4.5.2 Automatic operation

Automatic control shall ensure the following:

- a) receiving the production program(s);
- b) storing in the memory
  - the type and quantity of each of the constituent materials, and
  - the production volume required;
- c) full control of the plant operation and product manufacture without operator intervention, except perhaps for emptying the mixer.

Production shall be monitored by the operator who has one or more screens available displaying, in particular

- the quantities of constituent materials proportioned,
- the system status (e.g. in the form of a flow diagram),
- the procedure for material preparation and mixing operations, and possibly
  - a printer to print out the different sections under automation, and
  - information such as the mass of storage containers or truck,

and any other information required to operate the plant.

#### 4.5.3 Semi-automatic operation

The operator carries out

- display of composition,
- cycle start-up, and
- opening and closing of mixer.

The remaining operations are automated.

#### 4.5.4 Manual operation

All basic operations are controlled by the operator. Manual control shall be capable of ensuring the operation of the facility in the event of a failure in the automatic system. It may also be used to adjust equipment settings.

#### 4.6 Automatic function controls

This refers to devices providing the relationship between two or more operating parameters. The automatic controls cover the following:

- proportioning can only take place if the corresponding ingredient is present in the feed device of this proportioner;
- mixing can only be undertaken if all constituent materials have been proportioned and if each batched quantity corresponds to the quantity programmed, within the accuracy;
- transfer of materials from one machine to another can only be undertaken if the machine receiving it is in operation or ready to receive the materials.

These automatic controls have actions which take priority over orders coming from the plant automation system. Only the plant operator can, by voluntary action, override an automatic control instruction after this has been given.

#### 4.7 Control station

A control station specifically contains the following:

- indicators of operational parameters;
- display screens;
- tools to interface with the automation;
