7.6	Application layer procedures	56
7.6.1	Binary content download	56
7.6.1.1	Binary content download general requirements	56
7.6.1.2	LU10 interworking conventions and HTTP profile	56
7.6.1.2.1	LU10 interworking conventions and HTTP profile for "Simple binary content download"	56
7.6.1.2.2	LU10 interworking conventions and HTTP profile for "Enhanced binary content download"	57
7.6.1.2.3	LU10 interworking conventions and HTTP profile for "Generic multiprotocol binary content download"	58
7.6.1.3	Binary content download media type	58
7.6.1.4	Binary content download sequence	58
7.6.1.5	URI-based PP to FP security requirements	59
7.6.1.5.1	URI-based PP to FP confidentiality requirement	59
7.6.1.5.2	URI-based PP to FP authentication requirement	60
7.6.1.6	PP to FP enhanced interactivity	60
7.6.2	Software upgrade over the air (SUOTA)	61
7.6.2.1	SUOTA general requirements	61
7.6.2.1.1	Definitions	61
7.6.2.1.2	SUOTA general description	61
7.6.2.1.3	Protocol overview	62
7.6.2.1.4	SUOTA protocol steps: overview	63
7.6.2.2	Basic SUOTA protocol steps	64

7.6.2.2.1	Step 1-PP sends a "Handset version indication" command to the FP.....	64
7.6.2.2.2	Step 2-FP retrieves url of the next file to be downloaded (FP_URL2).....	65
7.6.2.2.3	Step 3-The PP receives the "Handset version available" command from the FP	65
7.6.2.2.4	Step 4-PP and FP gets the current file from the downloading server	66
7.6.2.3	Enhanced SUOTA protocol steps	67
7.6.2.3.1	Step 1- Enhanced SUOTA possible variants	67
7.6.2.3.2	Step 2-Enhanced SUOTA possible variants	67
7.6.2.3.3	Step 3-Enhanced SUOTA possible variants	68
7.6.2.3.4	Step 4-Enhanced SUOTA possible variants	68
7.6.2.4	PP security requirements in URL1 and URL2	68
7.6.2.5	Final notification of success and multiple step SUOTA	69
7.6.2.6	Notification of failure.....	69
7.6.2.7	User initiated SUOTA.....	70
7.6.3	HTTP-based applications.....	70
7.6.3.1	HTTP-based applications general requirements.....	70
7.6.3.2	Support of additional HTTP header fields	71
7.6.3.3	Support of additional media-types	71
7.6.3.4	Support of character encodings.....	71
7.6.3.5	Simple XHTML profile.....	72
7.6.3.6	Baseline XHTML profile	72
7.6.3.6.1	Basic elements support	72
7.6.3.6.2	Image element support	72
7.6.3.6.3	Tables support	73
7.6.3.6.4	Forms support.....	73
7.7	Interworking requirements	73
7.7.1	IWU-attributes information element.....	73
7.7.2	SDU sizes and setting of SDU boundaries.....	74
7.8	Physical layer procedures	74

Annex A (normative): HTTP Profiles..... **75**

A.1	Common HTTP profile (HTTP limited set nr.2).....	75
A.1.1	General requirements	75
A.1.2	Supported HTTP methods	75
A.1.2.1	GET method.....	75
A.1.2.2	HEAD method	75
A.1.2.3	POST method.....	75
A.1.2.4	Pipelining of requests.....	75
A.1.3	Request URI and Host header field.....	76
A.1.3.1	Use of the 'localhost' Host value	76
A.1.4	Supported HTTP header fields	77
A.1.5	Supported media types	77
A.1.6	Redirections of GET (or HEAD) requests.....	77
A.1.7	Byte-range operations.....	78
A.1.7.1	Byte-range operations related responses.....	79
A.1.7.2	Byte-range operations related header fields	79
A.1.7.3	Byte range operation use cases	79
A.1.7.3.1	Use case 1: standard downloading with default application packet size of 12 kbytes	79
A.1.7.3.2	Use case 2: standard downloading with application packet size of 48 kbytes	80
A.1.7.3.3	Use case 3: Download with interruption in-between	81
A.1.8	Supported HTTP errors	82
A.2	Extended HTTP profile (HTTP limited set nr.3).....	83
A.2.1	General requirements	83
A.2.2	POST method	83
A.2.2.1	Example of POST method	84
A.2.2.2	Redirection of POST requests.....	84
A.2.2.2.1	General requirements	84
A.2.2.2.2	Post-Redirect-Get pattern.....	85
A.2.3	Supported HTTP header fields	85

Annex B (normative): Basic SUOTA **86**

B.1	Basic SUOTA FP to management server interface	86
B.1.1	FP request (FP_URL1) construction	86
B.1.2	Private parameters	87
B.2	Basic SUOTA management server to FP interface	87
B.3	Basic SUOTA possible implementation (example)	88
Annex C (informative):	Enhanced SUOTA.....	90
C.1	Enhanced SUOTA example-use of Basic/Digest authentication and HTTPS from FP to MS, initiated by the PP	90
C.2	Enhanced SUOTA example-use of HTTPS from FP to MS, initiated by the MS.....	92
C.3	Enhanced SUOTA example-use of HTTPS from FP to MS, initiated by the FP	94
C.4	Enhanced SUOTA example-use of TR-069 [i.5]	96
C.4.1	Introduction and diagram	96
C.4.2	Detailed messages	98
C.4.2.1	General message format.....	98
C.4.2.2	Preliminary "Inform" exchange	98
C.4.2.2.1	Inform	98
C.4.2.2.2	InformResponse	99
C.4.2.3	Download exchange.....	99
C.4.2.3.1	Download (from server to FP)	99
C.4.2.3.2	DownloadResponse (from FP to server).....	100
C.4.2.3.3	Preventing too many Download messages	100
C.4.2.4	Transfer complete exchange	101
C.4.2.4.1	TransferComplete (from FP to server).....	101
C.4.2.4.2	TransferCompleteResponse (from server to FP).....	101
C.4.2.5	Error handling-"Fault" message.....	101
C.4.2.6	Alternative exchanges	102
C.4.2.6.1	RequestDownload (from server to FP).....	102
C.4.2.6.2	RequestDownloadResponse (from server to FP).....	103
Annex D (informative):	Bibliography.....	104

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Digital Enhanced Cordless Telecommunications (DECT).

The present document is based on EN 300 175, parts 1 [1] to 8 [8], EN 300 444 [14] and EN 301 649 [15]. General attachment requirements and speech attachment requirements are based on EN 301 406 [11] (replacing TBR 006 [i.2]) and EN 300 176-2 [10] (previously covered by TBR 010 [i.3]). Further details of the DECT system may be found in TR 101 178 [i.1].

The present document has been developed in accordance to the rules of documenting a profile specification as described in ISO/IEC 9646-6 [12].

The information in the present document is believed to be correct at the time of publication. However, DECT standardization is a rapidly changing area, and it is possible that some of the information contained in the present document may become outdated or incomplete within relatively short time-scales.

The present document is part 4 of a multi-part deliverable covering the New Generation DECT as identified below:

- Part 1: "Wideband speech";
- Part 2: "Support of transparent IP packet data";
- Part 3: "Extended wideband speech services";
- Part 4: "Light Data Services; Software Update Over The Air (SUOTA), content downloading and HTTP based applications".**

1 Scope

The present document specifies a set of functionalities of the New Generation DECT.

The functionalities defined in this profile are based on DECT base standard, EN 300 175, parts 1 [1] to 8 [8], DECT Generic Access Profile (GAP), EN 300 444 [14], and DECT Packet Radio Service (DPRS), EN 301 649 [15].

The New Generation DECT provides the following basic new functionalities:

- wideband voice service;
- packet-mode data service supporting Internet Protocol with efficient spectrum usage and high data rates.

All DECT devices claiming to be compliant with this Application Profile will offer at least the basic services defined as mandatory. In addition to that, optional features can be implemented to offer additional DECT services.

The aim of the present document is to guarantee a sufficient level of interoperability and to provide an easy route for development of DECT data applications, with the features of the present document being a common fall-back option available in all compliant to this profile equipment.

DECT does not standardize Internet Application protocols or other high layer data protocols, which are in the scope of other standardization organizations.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- Non-specific reference may be made only to a complete document or a part thereof and only in the following cases:
 - if it is accepted that it will be possible to use all future changes of the referenced document for the purposes of the referring document,
 - for informative references.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

2.1 Normative references

The following referenced documents are indispensable for the application of the present document. For dated references, only the edition cited applies. For non-specific references, the latest edition of the referenced document (including any amendments) applies.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in EN 301 649 [15] and the following apply:

distributed application: application available to the user on a DECT handset, for which part of the code (behaviour) and/or data is located on the handset (local tier) and part of it is located in the network (remote tier), and more specifically on one or more HTTP servers hosted by-or on behalf of-the FP's vendor

downloading server: See Software upgrade downloading server.

Light Data Services (LDS): basic DECT data services with limited data rate and simplified implementation

Management Server (MS): See Software upgrade management server.

software package: set of files sharing the same version identifier, and needed by the PP for installing or upgrading an application or a firmware

NOTE: The software package is often simply referred to as the "software".

software upgrade Downloading Server (DS): site of a PP vendor, or operated on behalf of a PP vendor, from where the software image releases can be downloaded

software upgrade Management Server (MS): site of a PP vendor, or operated on behalf of a PP vendor, where information about new software image releases for handsets, and their locations (on the downloading server) can be found

Software Upgrade Over The Air (SUOTA): capability to upgrade the Software or the Firmware in the PP by means of downloading it from the FP via the DECT air interface

software version identifier: parameter that identifies a software package, including the software package version

NOTE: From PP to FP, this parameter identifies the currently installed software package. From FP to PP it identifies the software package to be installed as a result of the upgrade (and is shared by all the files needed for the upgrade). Details and examples are provided in clause 7.5.5.2.1.

3.2 Symbols

For the purposes of the present document, the symbols given in EN 301 649 [15] and the following apply:

C	For conditional to support (process mandatory)
I	For irrelevant or out-of-scope (provision optional, process optional), not subject for testing
M	For mandatory to support (provision mandatory, process mandatory)
n	Current requested file number (value of the "fileNumber" parameter in the current "Handset Version indication" command)
N/A	For not-applicable (in the given context the specification makes it impossible to use this capability)
N _f	Number of files to be downloaded for a given Software upgrade ($1 \leq N_f \leq 15$).
O	For optional to support (provision optional, process mandatory)
O.x	Option comprising number of items
X	Excluded, not allowed

The symbols defined in this clause are applied for procedures, features, and services in the present document if not explicitly otherwise stated. The interpretation of status columns in all tables is as follows:

- Provision mandatory, process mandatory means that the indicated feature service or procedure shall be implemented as described in the present document, and may be subject to testing.
- Provision optional, process mandatory means that the indicated feature, service or procedure may be implemented, and if implemented, the feature, service or procedure shall be implemented as described in the present document, and may be subject to testing.

NOTE: The used notation is based on the notation proposed in ISO/IEC 9646-7 [13].

3.3 Abbreviations

For the purposes of the present document, the abbreviations given in EN 301 649 [15] and the following apply:

CLIP	Calling Line Identification Presentation
CLSS	ConnectionLess Supplementary Service
D-GMEP	DPRS Generic Media Encapsulation Protocol
DPRS	DECT Packet Radio Service
DS	Download(ing) Server
GAP	Generic Access Profile
GMCI	Generic Media Context Identifier
HTML	HyperText Markup Language
HTTP	HyperText Transfer Protocol
LDS	LightData Services
MS	Management Server
SSL	Secure Sockets Layer
SUOTA	Software Upgrade Over The Air
TLS	Transport Layer Security
URI	Uniform Resource Identifier
URL	Uniform Resource Locator

4 Description of services

4.1 Services covered by the present document

4.1.1 Introduction

The present document defines a set of what has been named "Light Data Services". Light Data Services are packet mode data services for specific applications, based on DPRS [15], and designed to be implementable using simplified operation modes.

The following Light Data Services are defined by the present document:

- Software Upgrade Over The Air (SUOTA); SUOTA may be automatic, user initiated, or possibly pushed from the management server.
- Binary content download; this is used in SUOTA for the actual software download, and can also be used to define proprietary distributed applications to be used on handsets.
- HTTP based applications; this is intended to allow the design of DECT specific applications based on a limited browsing functionality.

Further Light Data Services may be created by further releases of the present document, or by other DECT specifications.

4.1.2 Application scenario

The Light Data Services defined by the present document have been designed as a complement to voice service terminals. Therefore, the expected scenario is that PPs and FPs implementing the present specification, are also implementing one of the DECT voice services. The services defined by the present document have been optimized to be a natural complement of New Generation DECT; part 1: wideband speech [16], and New Generation DECT: part 3: extended wideband speech services [17]. However, it is also possible the use the Light Data Services in combination with plain GAP [14] terminals.

The application scenario assumes that there is a data connection at the DECT FP that allows the connectivity to external application servers that participate in the service from application point of view. Such data connectivity is typically via the Internet. However, other scenarios of connectivity may exist, including the case when the FP incorporates locally the network side application server. The network side implementation of the scenario is out of the scope of DECT standardization. However, the descriptions given in the present document will assume the most expected case of data connectivity via the Internet, and remote application servers located at any internet location. Other cases, as exotic connectivity or local implementation of the network side server are adaptation of the general scenario, without impact on the DECT air interface protocols.

4.2 Light Data Services Protocol architecture

The common characteristic of all Light Data Services defined by the present document is the use of the DPRS [15], generic media encapsulation interworking mode (DPRS [15], clause B.8). The generic media encapsulation is a DPRS facility that allows the direct transportation of multiple application protocols. In the case of the Light Data Services defined in the present document, the application protocol is HTTP (as defined by RFC 2616 [22]) supporting only the modes defined by DPRS [15], clause B.8.

Another characteristic of the protocol architecture defined in the present document is that the application protocol is transported without the use of any transport layer protocol (TCP [21] or UDP [20]). This approach, that has been chosen in order to simplify implementations, relies on the request/response nature of the application protocol and requires some collaboration from it in order to perform the tasks normally done by the transport layer (TCP).

The result of the approach is that PPs do not need to implement the TCP protocol.

4.2.1 Data protocol reference configuration

Figures 1 and 2 define the U-plane and C-plane protocol stacks used in the Light Data Services defined by the present document.
