This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/TC 147.

If this draft becomes a European Standard, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

Foreword

This document (prEN 13852-1:2009) has been prepared by Technical Committee CEN/TC 147 "Cranes - Safety", the secretariat of which is held by BSI.

This document is currently submitted to the CEN Enquiry.

This document will supersede EN 13852-1:2004.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[oSIST prEN 13852-1:2009](https://standards.iteh.ai/catalog/standards/sist/343e9150-f8bb-482c-a109-32f2251fc516/osist-pren-13852-1-2009)

<https://standards.iteh.ai/catalog/standards/sist/343e9150-f8bb-482c-a109-32f2251fc516/osist-pren-13852-1-2009>

Introduction

This European Standard has been prepared to be a harmonised standard to provide one means for general-purpose offshore cranes to conform to the essential health and safety requirements of the Machinery Directive, as mentioned in Annex ZA.

Absolute safety of cranes cannot be ensured by design alone, as their operation depends on the skill of operators, maintenance personnel and inspectors as well as on the numerous technical parameters relating to the crane and its operating environment, which may have large scatter.

As many of the hazards related to general-purpose offshore cranes relate to their operating environment and use, it is assumed in the preparation of this European Standard that all the relevant information relating to the use and operating environment of the crane has been exchanged between the manufacturer and user (as recommended in ISO 9374-1:1989 and ISO 9374-4:1989) covering such issues as, for example:

- clearances;
- requirements concerning protection against hazardous environments;
- processed materials, such as potentially flammable or explosive material (e.g. coal, powder type materials, etc).

This European Standard is a type C standard as stated in EN ISO 12100-1:2001.

The machinery concerned and the extent to which hazards, hazardous situations and hazardous events are covered are indicated in the scope of this European Standard.

When provisions of this type C standard are different from those which are stated in type A or B standards, the provisions of this type C standard take precedence over the provisions of the other standards, for machines that have been designed and built according to the provisions of this type C standard.

This standard is one part of EN 13852. The other part is:

Part 2: Floating Cranes i.e. a crane mounted on a vessel or barge designed for its support and transport, primarily intended for construction/deconstruction operations in a marine environment (This is not a harmonized standard).

prEN 13852-1:2009 (E)**1 Scope**

This European Standard specifies the requirements for general-purpose offshore cranes including their supporting pedestals or structures and lifting of personnel.

The standard applies to cranes manufactured after the date of issue.

This European Standard does not cover the hazards involved with or the use of the following:

- a) fabrication, transportation, assembly, dismantling, disabling, scrapping or changing the configuration of the crane;
- b) lifting accessories, i.e. any item between the hook and the load;
- c) design temperature below -40 °C;
- d) operations at an ambient temperature above 40 °C;
- e) lifting operations involving more than one crane;
- f) accidental loads due to collisions;
- g) hand powered cranes and other cranes with a rated capacity less than 2 t or outreach less than 8 m
- h) rescue operations;
- i) subsea lifting operations.

iTeh STANDARD PREVIEW
(standards.iteh.ai)

The significant hazards covered by this European standard are identified in Clause 4.

Where National Authorities permit the use of general-purpose offshore crane for the lifting of personnel, the crane would at least need to fulfil the requirements of this standard.

3 Terms and definitions

For the purposes of this European Standard, the terms and definitions given in EN ISO 12100-1:2003 apply. Additional terms and definitions specifically addressed in this document are added below.

NOTE Definitions are in alphabetical order for the English language version only.

3.1 automatic overload protection system (AOPS)
system that automatically safeguards and protects the crane against the effects of a gross overload during operation by allowing the hook to be pulled away from the crane in downwards direction within specified offlead and sidelead angles, without causing significant damage to the crane.

3.2 actual hook load
total static weight of the load including any equipment placed between the load and the hook

3.3 component
single part or assembly of parts of a crane, which is subjected to load effects (wire ropes, stationary or running, traverse beams, pendant bars, sheaves, axles, gears, couplings, brakes, hoists, hydraulic cylinders, shafts, shackles, swivels and pins)

3.3.1 primary component
component which is essential for the mechanical and structural integrity of the crane, e.g. boom and a-frame lacing members

3.3.2 secondary component
any component that is not a primary component

3.4 crane stiffness
vertical static force applied at the hook required to produce unit vertical deflection assuming the pedestal support structure to be rigid

3.5 design load
maximum theoretical load ($R_0 \times \Phi_0$) that can be safely lifted by the crane at any given radius in the design condition such that the permissible stresses are not exceeded,
NOTE see Figure 1

3.6 design moment
maximum moment caused by the design load multiplied by radius

$$R_0 \times \phi_0 \geq R_n \times \phi_n + \text{"Loss"} \quad (1)$$

KEY

X radius

Y load

1 design load $R_0 \times \phi_0$ 2 operational load $R_n \times \phi_n$ 3 internal lift R_0 4 offshore lift R_n

"Loss" effects due to environmental conditions and out of plane influences

Figure 1 — Design load**3.7****design temperature (T_d)**

reference temperature used as a criterion for the selection of materials. The design temperature is the lowest mean daily temperature.

3.8**dynamic coefficient (ϕ_n)**

ratio between the maximum dynamic load at the hook and the actual hook load for any given configuration or operating condition

3.9**emergency operation system (EOS)**

a back-up system for limited operation of the crane, if the normal system of operation is inoperative

3.10**folding system**

mechanical system, which enable the knuckle boom assembly to be folded or unfolded
