## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 17514 was prepared by Technical Committee ISO/TC 114, *Horology*, Subcommittee SC 5, *Luminescence*.

# Time-measuring instruments — Photoluminescent deposits — Test methods and requirements

## 1 Scope

This International Standard specifies the test methods of various aspects of the photoluminescent deposits applied to time-measuring instruments, together with the requirements related to them.

## 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 3157:1991, *Radioluminescence for time measurement instruments — Specifications*

## 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

### 3.1

#### **photoluminescent deposit**

non-radioactive substance applied to a support, which is able to accumulate energy and release it as light

### 3.2

#### **luminance**

ratio of the light intensity to the surface unit of emission for a remote observer

NOTE This is expressed as nanocandelas per square centimetre ( $\text{ncd}/\text{cm}^2$ ).

### 3.3

#### **luminance degradation coefficient**

decrease of luminance as a function of time

### 3.4

#### **legibility**

ability of the luminescent item to be seen distinctly

### 3.5

#### **legibility limit**

minimum luminous intensity with which the luminescent item can be seen distinctly

### 3.6

#### **luminous intensity**

the light intensity for a remote observer

NOTE This is expressed in  $\text{ncd}$ .

## 4 Test methods and requirements

### 4.1 Tests on sample

#### 4.1.1 Test sample

( $30 \pm 1$ ) mg of the photoluminescent deposit shall be applied evenly to a surface area of ( $1 \pm 0,03$ ) cm<sup>2</sup> at the end of a white-coated metallic support.

The white colour shall be the safety white No. 9003 of the RAL (Reichsausschuss für Lieferbedingungen) colour range.

#### 4.1.2 Colours

The standardized colours shall be those defined in 4.2.1 of ISO 3157:1991. Checking of colour shall be done by visual examination in daylight, not in direct sunlight. Measurements according to CIE 1976 L\*a\*b\* are a possible alternative.

#### 4.1.3 Luminous intensity and luminance

Luminous intensity of the test sample shall be checked according to the following procedures:

- a) Store the test sample at ambient temperature for at least 8 h in the dark.
- b) Irradiate the test sample under the D65 light source at 200 lx for 30 min or 400 lx for 20 min, and then store it in the dark.
- c) Measure the luminous intensity of the test sample 30 min, 90 min and 180 min after its storage. If the time required for reaching the legibility limit or the luminance degradation coefficient is needed, the curve may be extrapolated down to a luminance of 40 ncd/cm<sup>2</sup>. A photometer shall be used for the measurement.

Throughout the test periods b) and c), the ambient temperature shall be ( $23 \pm 2$ ) °C and the relative humidity shall be ( $50 \pm 15$ ) %.

#### 4.1.4 Ageing resistance

Ageing resistance of the test sample shall be checked according to the following procedures:

- a) Measure the luminous intensity of the test sample according to 4.1.3.
- b) Expose the test sample to UV light, humidity and temperature as described in 4.4.2 of ISO 3157:1991. The duration of the exposure shall be extended to 48 h.
- c) Visually inspect the test sample; no discoloration, crack, damage, breakage or exfoliation shall be allowed.
- d) Measure again the luminous intensity (according to 4.1.3) after 24 h of storage in the dark. The luminous intensity loss shall be less than 10 %.

#### 4.1.5 High/low temperature resistance

High/low temperature resistance of the test sample shall be checked according to the following procedures:

- a) Measure the luminous intensity of the test sample according to 4.1.3.
- b) Store the test sample in the dark at ( $80 \pm 5$ ) °C and ( $50 \pm 15$ ) % relative humidity for 1 h.
- c) Store the test sample in the dark at ( $-20 \pm 5$ ) °C for 1 h; the time to pass from ( $80 \pm 5$ ) °C to ( $-20 \pm 5$ ) °C shall be at least 30 min.
