Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 211, *Geographic information/Geomatics*.

ISO 19163 consists of the following parts, under the general title *Geographic information — Content components and encoding rules for imagery and gridded data*:

— *Part 1: Content model* [Technical Specification]

Other parts are planned, but are not yet specified.

Introduction

Geographic imagery and gridded thematic data are widely used in the geospatial community and related fields.

A preliminary work item on imagery and gridded data components, carried out by ISO/TC 211 in 1999 to 2000, provides a summary of the conceptual classification of gridded data based on spatial and attribute properties and identifies five basic components of imagery and gridded data (ISO/TC 211 N 1017). ISO/TS 19101-2, ISO 19123 and ISO/TS 19129 specify domains and ranges of imagery, grids and coverages, and their associated relationships. ISO/TS 19129 breaks down the metadata into discovery, structural, acquisition and quality metadata. However, there are no detailed descriptions on each category and no clear associations with metadata defined in ISO 19115:2003, ISO 19115-2, ISO/TS 19130 and ISO/TS 19130-2.

Imagery is acquired by remote sensors directly or derived from source imagery. Value-added image processing can be used to derive physical properties of a remote object from images (ISO/TS 19101-2). Besides the derived images, imagery can also be integrated with other data sources to produce new gridded coverage data for a specific theme, called thematic data, which is widely used in various applications. However, the characteristics of thematic data are not covered by the existing International Standards and Technical Specifications noted above.

ISO/TS 19130 identifies the type of remote sensors by the measurand of the sensor, e.g. optical radiation, microwave energy and SONAR (acoustic) energy. Images acquired by optical sensors have different appearances and characteristics compared with those by a microwave sensor, e.g. SAR data.

The framework defined in ISO/TS 19129 describes imagery, gridded and coverage data at multiple levels, including an abstract level, a content model level and an encoding level. The first two levels combine a number of well-defined content structures in accordance with ISO 19123 and define the contents of continuous quadrilateral gridded coverages with grids of both constant and variable cell sizes. However, the content model level does not specify the necessary metadata for common understanding when integrating datasets encoded in different formats. At the encoding level, ISO/TS 19129 does not provide the explicit encoding rules for mapping content model to machine-independent encoding structure, which is crucial for the mapping and translation of images in different formats without losing information.

Based on the frameworks defined in ISO/TS 19101-2 and ISO 19123, this Technical Specification specifies the categories of imagery and gridded data and establishes a corresponding hierarchical content model. Categories of imagery and gridded data are defined based on thematic and spatial attributes and sensor types. The content model is then defined to describe the required content components of each category, including the spatial and attribute structures and the critical metadata entries as well. These metadata entries are specified as the minimum required metadata information for the purpose of common understanding. Traditionally, remote sensing data products generally have a header part and a data part. This Technical Specification describes the minimum content requirements for the header part.

For ease of implementation, this Technical Specification defines encoding rules to map the content models to XML-based encodings, following the general encoding rules defined in ISO 19118 and the encoding rules for UML-to-GML application schema defined in ISO 19136:2007, Annex E. Since GMLCOV schema (OGC 09-146r2) is optimized for handling coverages, the coverage component of the schema can be based on GMLCOV.

An increasingly large volume of image and gridded data, both natural and synthetic, is being produced because more remote sensors are becoming available. These data are encoded in diverse formats, such as GeoTIFF, BIIF, HDF-EOS, JPEG 2000, NetCDF and others as described in ISO/TR 19121. These encoding formats follow different data models, preventing them from being interoperable. In order to encode the contents defined in this Technical Specification into these data formats, ISO 19163 has been split into multiple parts with this Technical Specification defining the content components and general encoding rules and the subsequent parts defining the binding between the contents and individual physical data formats.

Geographic information — Content components and encoding rules for imagery and gridded data —

Part 1: Content model

1 Scope

This Technical Specification classifies imagery and regularly spaced gridded thematic data into types based on attribute property, sensor type and spatial property, and defines an encoding-neutral content model for the required components for each type of data. It also specifies logical data structures and the rules for encoding the content components in the structures.

The binding between the content and a specific encoding format will be defined in the subsequent parts of ISO 19163.

This Technical Specification does not address LiDAR, SONAR data and ungeoreferenced gridded data.

The logical data structures and the rules for encoding the content components will be addressed in the subsequent parts of ISO 19163.

2 Conformance

This Technical Specification standardizes the categories of imagery and regularly spaced gridded thematic data as well as their core content models. There is one conformance class for each data category. Any set of imagery and regularly spaced gridded thematic data claiming conformance to this Technical Specification shall satisfy the corresponding requirements defined in the abstract test suite in [Annex A](#).

3 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

1) At the publication time of this Technical Specification, only ISO 19115-2:2009, which references to ISO 19115:2003, is available. The new version of ISO 19115-2, which is under revision at the publication time of this Technical Specification, will refer to ISO 19115-1:2014.

4 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

4.1 attribute

named property of an entity

Note 1 to entry: Describes a geometrical, topological, thematic, or other characteristic of an entity.

[SOURCE: ISO/IEC 2382:2015, 2121440, modified — Note 1 to entry has been added.]

4.2 binding

specification of a mapping relating the information defined in a *content model* (4.3) (data and metadata) to the data format that carries that information

4.3 content model

information view of an application schema

Note 1 to entry: In this Technical Specification, a content model describes the required content components and their interrelationship of *imagery* (4.12) and gridded *thematic data* (4.14).

[SOURCE: ISO/TS 19129:2009, 4.1.2, modified — Note 1 to entry has been added.]

4.4 conversion rule

rule for converting instances in the input data structure to instances in the output data structure

[SOURCE: ISO 19118:2011, 4.7]

4.5 encoding rule

identifiable collection of *conversion rules* (4.4) that define the encoding for a particular data structure

EXAMPLE XML, ISO 10303-21, ISO/IEC 8211.

Note 1 to entry: An encoding rule specifies the types of data to be converted as well as the syntax, structure and codes used in the resulting data structure.

[SOURCE: ISO 19118:2011, 4.14]

4.6 fused image

image produced by fusing images from multiple sources

4.7 geopositioning

determining the geographic position of an object

[SOURCE: ISO/TS 19130:2010, 4.36, modified]

4.8 georectified

corrected for positional displacement with respect to the surface of the Earth

[SOURCE: ISO 19115-2:2009, 4.12]

iTeh STANDARD PREVIEW
(standards.iteh.ai)

SIST-TS ISO/TS 19163-1:2017

<https://standards.iteh.ai/catalog/standards/sist/4c30aef2-e253-4de2-bf93-c5f51e77f530/sist-ts-iso-ts-19163-1-2017>

4.9**georeferenceable**

associated with a *geopositioning* (4.7) information that can be used to convert *grid* (4.10) coordinate values to values of coordinates referenced to an external coordinate reference system related to the Earth by a datum

4.10**grid**

network composed of two or more sets of curves in which the members of each set intersect the members of the other sets in an algorithmic way

[SOURCE: ISO 19123:2005, 4.1.23, modified]

4.11**gridded data**

data whose *attribute* (4.1) values are associated with positions on a *grid* (4.10) coordinate system

Note 1 to entry: Gridded data are a subtype of coverage data, which represent attribute values of geographic features in terms of a spatial grid.

[SOURCE: ISO 19115-2:2009, 4.17, modified — Note 1 to entry has been added.]

4.12**imagery**

representation of phenomena as images produced by electronic and/or optical techniques

Note 1 to entry: The term *imagery* is often used colloquially with various meanings in different contexts. It is often used to describe any set of gridded, point set or other form of coverage data that can be portrayed.

[SOURCE: ISO/TS 19101-2:2008, 4.14, modified — Note 1 to entry has been added.]

4.13**looks**

groups of signal samples in a SAR processor that splits the full synthetic aperture into several sub-apertures, each representing an independent look of the identical scene

Note 1 to entry: The resulting image formed by incoherent summing of these looks is characterized by reduced speckle and degraded spatial resolution.

4.14**thematic data**

gridded data (4.11) whose *attribute* (4.1) values describe characteristics of a *grid* (4.10) coverage feature in a grid format

Note 1 to entry: Most gridded thematic data are derived from *imagery* (4.12) data using geophysical/atmospheric inversion algorithms. Gridded thematic data may also be obtained from other sources such as digitization of topographic map sheets.

4.15**ungeoreferenced grid**

gridded data (4.11) that does not include any information that can be used to determine a cell's geographic coordinate values

EXAMPLE A digital photo without georectification information included.

5 Symbols and abbreviated terms

5.1 Abbreviated terms

BIIF	Basic Image Interchange Format
CRS	Coordinate Reference System
DEM	Digital Elevation Model
EOS	Earth Observing System
HDF	Hierarchical Data Format
JPEG200	Joint Photographic Experts Group 2000
netCDF	network Common Data Form
SAR	Synthetic aperture radar
TIFF	Tagged Image File Format
UML	Unified Modeling Language

5.2 UML notations

This Technical Specification presents conceptual models of imagery and gridded data, specified in the Unified Modeling Language (UML). ISO 19103 describes the way in which UML is used in the ISO 19100²⁾ family of standards. It differs from standard UML only in the existence and interpretation of some special stereotypes, in particular, "CodeList". ISO 19103 specifies the basic data types used in the UML model. The UML diagrams defined in this Technical Specification represent conceptual models only and are not intended for automatic encoding within XML Schema.

[Annex B](#) contains a data dictionary for the UML models defined in this Technical Specification.

[Table 1](#) lists the prefixes of UML classes used in the referenced ISO standards in this Technical Specification. IE is the prefix of the UML classes defined in this Technical Specification. In [Table 1](#), the first column describes the prefix used in the packages of the second column and the third column is the ISO standard where the package is defined.

2) This International Standard is under preparation.

Table 1 — UML package identifiers

Identifier	Package	International Standard
EX	Extent information	ISO 19115-1
LE	Lineage extended	ISO 19115-2
LI	Lineage	ISO 19115-1
MD	Metadata	ISO 19115-1
MI	Metadata for imagery	ISO 19115-2
SD	Sensor data	ISO/TS 19130
CV	Coverage	ISO 19123
CA	Calibration and validation of sensor	ISO/TS 19159-1
GM	Geometry root	ISO 19107
IE	Content components and encoding rules for imagery and gridded data	ISO 19163

6 Related International Standards

[Figure 1](#) illustrates the relationship between this Technical Specification and other International Standards related to imagery and gridded data. This Technical Specification fits the reference model defined in ISO/TS 19101-2 and follows the abstract content framework defined in ISO 19123. CV_Coverage is chosen as the super-class to establish the content component model of imagery and gridded data.

This Technical Specification refers to metadata related to imagery and gridded data defined in ISO 19115-1 and ISO 19115-2, the sensor information related to acquisition of imagery defined in ISO/TS 19130 and the calibration and validation of sensors defined in ISO/TS 19159-1.

This Technical Specification defines an UML schema for the content model which can be bound with any widely used data formats of imagery and gridded data, such as GeoTIFF, BIIF, JPEG 2000, NetCDF and HDF.

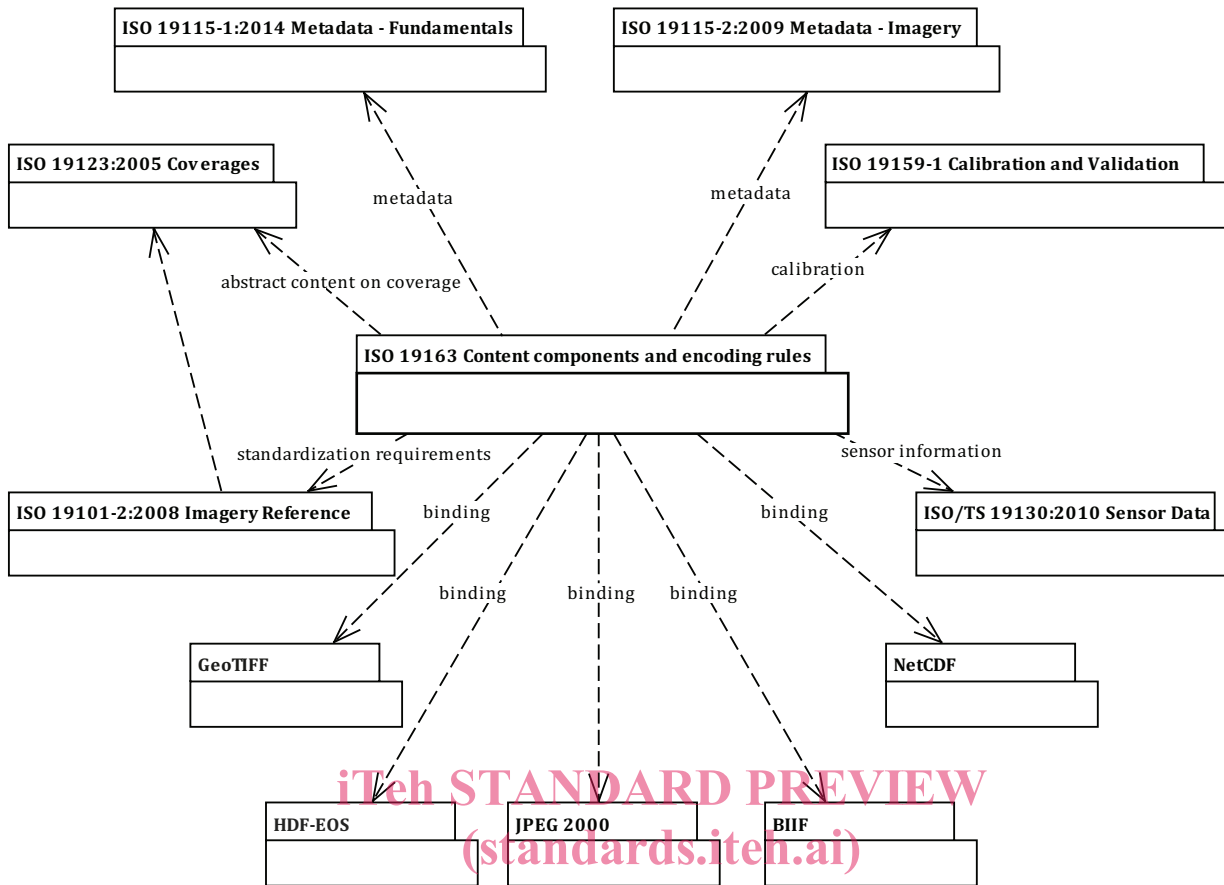

Figure 1 Relationship with related International Standards
<https://standards.iso.org/standards/catalog/standards/sist-ts-iso-ts-19163-1-2017>

7 Categories of imagery and gridded data

7.1 General

Clause 7 categorizes imagery according to digital sensor types and gridded data according to the attribute and geometry properties. The required content components of each data category are specified in UML content models of Clause 8.

The intention of this Technical Specification is not to define a comprehensive classification system of imagery and gridded data, but to specify the contents of some categories of them. A hierarchical category framework of imagery and gridded data is defined in Figure 2. The root of the framework is Coverage defined in ISO 19123. Imagery and gridded data are a subclass of coverage. The two subclasses of imagery and gridded data, which are imagery data and thematic gridded data, are defined in this Technical Specification.

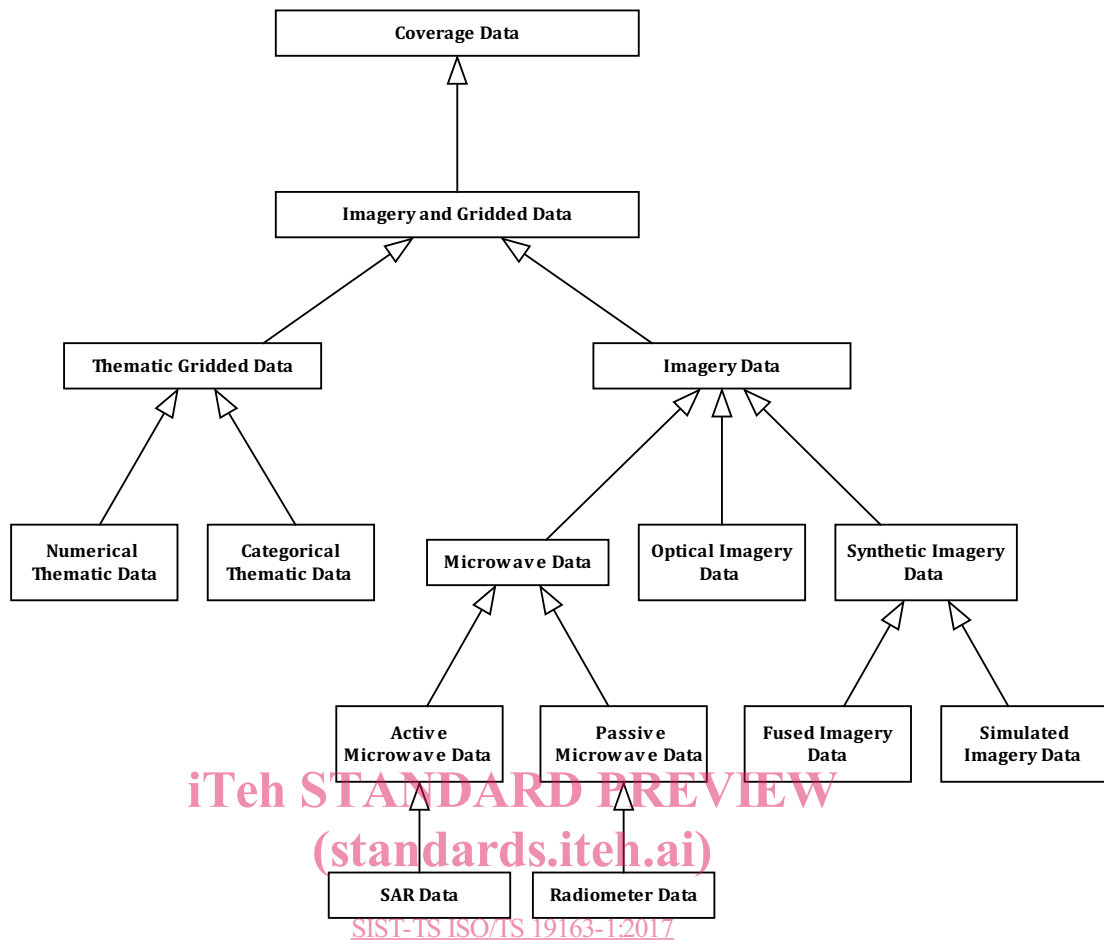

Figure 2 — Categories of imagery and gridded data

7.2 Imagery

Imagery is a kind of coverage whose attribute values are numerical representations of the physical parameters (e.g. radiance) measured by imagery sensors. According to ISO/TS 19101-2, a sensor can be classified as an electromagnetic energy sensor or a mechanical wave energy sensor based on the type of energy sensed by the sensor. The former class is further categorized into an optical sensor, a microwave sensor or a light detection and ranging sensor (LiDAR) according to the measurand of the sensor (ISO/TS 19130). SONAR is a typical example of mechanical wave energy sensor. These sensors produce optical, microwave, LiDAR and SONAR imagery data, respectively.

The data acquired by LiDAR and SONAR, which exhibit distinct characteristics that differ from optical images and microwave data, are not covered by this Technical Specification due to the limit of the scope. These types of data may be addressed in a future extension or subsequent part of ISO 19163.

Optical images are acquired from visible and infrared sensors by detecting the radiation reflected or emitted from target objects (ISO/TS 19101-2). Different materials reflect, absorb or emit radiation at different wavelengths, and accordingly each object type has a spectral signature. Analysing spectral signatures within remotely sensed images identifies differentiation between these objects. Thus, images may be classified depending on the number of spectral bands, for example panchromatic, multispectral and hyperspectral.

Microwave data are classified into active and passive microwave data corresponding to active and passive microwave sensors. Synthetic aperture radar (SAR) is a typical active microwave sensor that uses a series of radar pulses transmitted and received over time from a moving platform to create an image, as specified by ISO/TS 19130.
