Fire detection and fire alarm systems - Part 7: Smoke detectors - Point detectors using scattered light, transmitted light or ionisation

Systèmes de détection et d'alarme incendie - Partie 7:
DéTECTEURS de fumée - DéTECTEURS ponctuels fonctionnant
suivant le principe de la diffusion de la lumière, de la
transmission de la lumière ou de l'ionisation

Brandmeldeanlagen - Teil 7: Rauchmelder - Punktförmige
Melder nach dem Streulicht-, Durchlicht- oder
Ionisationsprinzip

This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/TC 72.

If this draft becomes a European Standard, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

prEN 54-7:2011 (E)**Foreword**

This document (prEN 54-7:2011) has been prepared by Technical Committee CEN/TC 72 "Fire detection and fire alarm systems", the secretariat of which is held by BSI.

This document is currently submitted to the CEN Enquiry.

This document will supersede EN 54-7:2000.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association, and supports essential requirements of EU Directive(s).

For relationship with EU Directive, see informative Annex ZA, which is an integral part of this document.

EN 54, *Fire detection and fire alarm systems*, consists of the following parts:

- Part 1: Introduction
- Part 2: Control and indicating equipment
- Part 3: Fire alarm devices – Sounders
- Part 4: Power supply equipment
- Part 5: Heat detectors – Point detectors
- Part 7: Smoke detectors – Point detectors using scattered light, transmitted light or ionization
- Part 10: Flame detector – Point detectors
- Part 11: Manual call points
- Part 12: Smoke detectors – Line detector using an optical light beam
- Part 13: Compatibility assessment of system components
- Part 14: Guidelines for planning, design, installation, commissioning, use and maintenance
- Part 15: Point detectors using a combination of detected phenomena
- Part 16: Voice alarm control and indicating equipment
- Part 17: Short circuit isolators
- Part 18: Input/output devices
- Part 20: Aspirating smoke detectors
- Part 21: Alarm transmission and fault warning routine equipment
- Part 22: Line-type heat detectors

STANDARD PREVIEW
(standards.iteh.ai)

oSIST prEN 54-7:2011

<https://standards.iteh.ai/catalog/standards/sist/0f1923e6-d238-4b07-a74c-6aca9c03c527/osist-pr-en-54-7-2011>

- Part 23: Fire alarm devices – Visual alarms
- Part 24: Components of voice alarm systems – Loudspeakers
- Part 25: Components using radio links and system requirements
- Part 26: Carbon monoxide detectors – Point detectors
- Part 27: Duct smoke detectors
- Part 28: Non-resettable (digital) line type heat detectors
- Part 29: Multi-sensor fire detectors - Point detectors using a combination of smoke and heat sensors
- Part 30: Multi-sensor fire detectors - Point detectors using a combination of carbon monoxide and heat sensors
- Part 31: Multi-sensor detector – Point detectors using a combination of smoke, carbon monoxide and optionally heat sensors
- Part 32: Guidelines for the planning, design, installation, commissioning, use and maintenance of voice alarm systems

NOTE This list includes standards that are in preparation and other standards may be added. For current status of published standards refer to www.cen.eu.

ITEH STANDARD PREVIEW
(standards.iteh.ai)

prEN 54-7:2011 (E)

1 Scope

This European Standard specifies requirements, test methods and performance criteria for point smoke detectors that operate using scattered light, transmitted light or ionization, for use in fire detection and fire alarm systems for buildings (see EN 54-1:1996). This European Standard includes point smoke detectors that incorporate more than one smoke sensor operating on these principles, and additional requirements and test methods for such detectors are given in Annex N.

For other types of smoke detector, or smoke detectors working on different principles, this standard should only be used for guidance. Smoke detectors with special characteristics and developed for specific risks are not covered by this standard.

NOTE Certain types of detector contain radioactive materials. The national requirements for radiation protection differ from country to country and they are not specified in this standard.

2 Normative references

3 Terms and definitions

For the purposes of this standard, the following term and definition and those given in EN 54-1:1996 apply:

3.1

closed detector

optical or ionization detector with the sensing volume inside the enclosure

[oSIST prEN 54-7:2011](https://standards.iteh.ai/catalog/standards/sist/0f1923e6-d238-4b07-a74c-6aca9e651c52/osist-pren-54-7-2011)

3.2

open detector

Optical smoke detector with the sensing volume(s) outside the enclosure

<https://standards.iteh.ai/catalog/standards/sist/0f1923e6-d238-4b07-a74c-6aca9e651c52/osist-pren-54-7-2011>

3.3

response value

aerosol density in the proximity of the specimen at the moment that it generates an alarm signal, when tested as described in 5.1.5

NOTE The response value may depend on signal processing in the detector and in the control and indicating equipment.

4 Requirements

4.1 Compliance

In order to comply with this standard the detector shall meet the requirements of clause 4, which shall be verified by visual inspection or engineering assessment, shall be tested as described in clause 5 and, for detectors with more than one smoke sensor, Annex N and shall meet the requirements of the tests.

4.2 Operational reliability

4.2.1 Individual alarm indication

Each detector shall be provided with an integral red visual indicator, by which the individual detector, which released an alarm, can be identified, until the alarm condition is reset. Where other conditions of the detector can be visually indicated, they shall be clearly distinguishable from the alarm indication, except when the detector is switched into a service mode. For detachable detectors the indicator may be integral with the base or the detector head. The visual indicator shall be visible from a distance of 6 m directly below the detector, in an ambient light intensity up to 500 lux. To confirm this, the detector shall be assessed in accordance with clause 5.2.1.

Note : The alarm condition is reset manually at the control and indicating equipment (See EN 54-2).

4.2.2 Connection of ancillary devices

Where the detector provides for connections to ancillary devices (e.g. remote indicators, control relays), open- or short-circuit failures of these connections shall not prevent the correct operation of the detector. To confirm this, the detector shall be assessed in accordance with clause 5.2.2.

4.2.3 Monitoring of detachable detectors

For detachable detectors, a means shall be provided for a remote monitoring system (e.g. the control and indicating equipment) to detect the removal of the head from the base, in order to give a fault signal. To confirm this, the detector shall be assessed in accordance with clause 5.2.3.

4.2.4 Manufacturer's adjustments

It shall not be possible to change the manufacturer's settings except by special means (e.g. the use of a special code or tool) or by breaking or removing a seal. To confirm this, the detector shall be assessed in accordance with clause 5.2.4.

4.2.5 On-site adjustment of response behaviour

If there is provision for on-site adjustment of the response behaviour of the detector then:

- a) for each setting, at which the manufacturer claims compliance with this standard, the detector shall comply with the requirements of this standard, and access to the adjustment means shall only be possible by the use of a code or special tool or by removing the detector from its base or mounting;
- b) any setting(s), at which the manufacturer does not claim compliance with this standard, shall only be accessible by the use of a code or special tool, and it shall be clearly marked on the detector or in the associated data, that if these setting(s) are used, the detector does not comply with the standard.

NOTE These adjustments may be carried out at the detector or at the control and indicating equipment.

To confirm this, the detector shall be assessed in accordance with clause 5.2.5.

4.2.6 Protection against the ingress of foreign bodies

4.2.6.1 Closed detectors

Closed detectors shall be so designed that a sphere of diameter $(1,3 \pm 0,05)$ mm cannot pass into the sensor chamber(s).

NOTE This requirement is intended to restrict the access of insects into the sensitive parts of the detector. It is known that this requirement is not sufficient to prevent the access of all insects, however it is considered that extreme restrictions on the size of access holes may introduce the danger of clogging by dust etc. It may therefore be necessary to take other precautions against false alarms due to the entry of small insects.

4.2.6.2 Open detectors

Open detector shall be designed such that

- a) a sphere of $(1,3 \pm 0,05)$ mm cannot pass into any enclosure containing active optoelectronic components
- b) a total block of the detector surface shall not cause a false alarm and shall signal a fault.
- c) An object moving within the sensitive volume for 60 seconds per velocity shall not cause a false alarm.
- d) An object moving at 0.2 rps with minimum distance of $6 \text{ mm} \pm 1 \text{ mm}$ to the nearest point of the surface of the detector shall not cause false alarm but may give fault signal.

To confirm this, the detector shall be assessed in accordance with clause 5.2.6.

4.2.7 Response to slowly developing fires

The provision of "drift compensation" (e.g. to compensate for sensor drift due to the build up of dirt in the detector), shall not lead to a significant reduction in the detector's sensitivity to slowly developing fires.

Since it is not practical to make tests with very slow increases in smoke density, an assessment of the detector's response to slow increases in smoke density shall be made by analysis of the circuit/software, and/or physical tests and simulations.

The detector shall be deemed to meet the requirements of this clause if this assessment shows that:

- a) for any rate of increase in smoke density R , which is greater than $A/4$ per hour (where A is the detector's initial uncompensated response value), the time for the detector to give an alarm does not exceed $1,6 \times A/R$ by more than 100 s; and
- b) the range of compensation is limited such that, throughout this range, the compensation does not cause the response value of the detector to exceed its initial value by a factor greater than 1,6.

NOTE Further information about the assessment of these requirements is given in annex L.

To confirm this, the detector shall be assessed in accordance with clause 5.2.7.

4.2.8 Marking

Each detector shall be clearly marked with the following information:

- a) the number of this standard and its date (i.e. EN 54-7:2009);

prEN 54-7:2011 (E)

- b) the name or trademark of the manufacturer or supplier;
- c) the model designation (type or number);
- d) the wiring terminal designations;
- e) some mark(s) or code(s) (e.g. serial number or batch code), by which the manufacturer can identify, at least, the date or batch and place of manufacture, and the version number(s) of any software, contained within the detector.

For detachable detectors, the detector head shall be marked with a), b), c) and e), and the base shall be marked with, at least c) (i.e. its own model designation) and d).

Where any marking on the device uses symbols or abbreviations not in common use then these shall be explained in the data supplied with the device.

The marking shall be visible during installation of the detector and shall be accessible during maintenance.

The markings shall not be placed on screws or other easily removable parts.

To confirm this, the detector shall be assessed in accordance with clause 5.2.8.

4.2.9 Data

Detectors shall either be supplied with sufficient technical, installation and maintenance data to enable their correct installation and operation¹⁾ or, if all of these data are not supplied with each detector, reference to the appropriate data sheet shall be given on, or with each detector. To confirm this, the detector shall be assessed in accordance with clause 5.2.9.

NOTE Additional information may be required by organisations certifying that detectors produced by a manufacturer conform to the requirements of this standard.

4.2.10 Additional requirements for software controlled detectors**4.2.10.1 General**

For detectors which rely on software control in order to fulfil the requirements of this standard, the requirements of 4.11.2, 4.11.3 and 4.11.4 shall be met.

4.2.10.2 Software documentation

4.2.10.2.1 The manufacturer shall submit documentation which gives an overview of the software design. This documentation shall be in sufficient detail for the design to be inspected for compliance with this standard and shall include at least the following:

- a) a functional description of the main program flow (e.g. as a flow diagram or structogram) including:
 - 1) a brief description of the modules and the functions that they perform;
 - 2) the way in which the modules interact;
 - 3) the overall hierarchy of the program;

¹⁾ To enable correct operation of the detectors, these data should describe the requirements for the correct processing of the signals from the detector. This may be in the form of a full technical specification of these signals, a reference to the appropriate signalling protocol or a reference to suitable types of control and indicating equipment etc.

- 4) the way in which the software interacts with the hardware of the detector;
 - 5) the way in which the modules are called, including any interrupt processing.
- b) a description of which areas of memory are used for the various purposes (e.g. the program, site specific data and running data);
- c) a designation, by which the software and its version can be uniquely identified.

4.2.10.2.2 The manufacturer shall have available detailed design documentation, which only needs to be provided if required by the testing authority. It shall comprise at least the following:

- a) an overview of the whole system configuration, including all software and hardware components;
- b) a description of each module of the program, containing at least:
 - 1) the name of the module;
 - 2) a description of the tasks performed;
 - 3) a description of the interfaces, including the type of data transfer, the valid data range and the checking for valid data.
- c) full source code listings, as hard copy or in machine-readable form (e.g. ASCII-code), including all global and local variables, constants and labels used, and sufficient comment for the program flow to be recognized;
- d) details of any software tools used in the design and implementation phase (e.g. CASE-tools, compilers).

4.2.10.3 Software design

oSIST prEN 54-7:2011

<https://standards.iteh.ai/catalog/standards/sist/0f1923e6-d238-4b07-a74c-6a2b07052011/osist-pr-en-54-7-2011>

In order to ensure the reliability of the detector, the following requirements for software design shall apply:

- a) the software shall have a modular structure;
- b) the design of the interfaces for manually and automatically generated data shall not permit invalid data to cause error in the program operation;
- c) the software shall be designed to avoid the occurrence of deadlock of the program flow.

4.2.10.4 The storage of programs and data

The program necessary to comply with this standard and any preset data, such as manufacturer's settings, shall be held in non-volatile memory. Writing to areas of memory containing this program and data shall only be possible by the use of some special tool or code and shall not be possible during normal operation of the detector.

Site-specific data shall be held in memory which will retain data for at least two weeks without external power to the detector, unless provision is made for the automatic renewal of such data, following loss of power, within 1 h of power being restored.

To confirm this, the detector shall be assessed in accordance with clause 5.2.10.
