

# Standard Specification for Carbon and Alloy Steel Bars Subject to End-Quench Hardenability Requirements<sup>1</sup>

This standard is issued under the fixed designation A 304; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

*This standard has been approved for use by agencies of the Department of Defense.*

## 1. Scope\*

1.1 This specification covers hot-worked alloy, carbon, and carbon-boron steels in a variety of compositions and sizes which may attain specified depth of hardening in the end quench test. These steel compositions are identified by the suffix letter “H” added to the conventional grade number.

1.2 This specification provides for analyses other than those listed under Table 1 and Table 2. Special hardenability limits are also permissible when approved by the purchaser and manufacturer.

1.3 The values stated in inch-pound units are to be regarded as the standard.

A 29/A 29M Specification for Steel Bars, Carbon and Alloy, Hot-Wrought, General Requirements for

A 255 Test Method for End-Quench Test for Hardenability of Steel

E 112 Test Methods for Determining Average Grain Size

E 527 Practice for Numbering Metals and Alloys (UNS)

## 3. Terminology

### 3.1 Definitions of Terms Specific to This Standard:

3.1.1 *hardenability*—The relative ability of a steel to harden under heat treatment becomes apparent in the degree to which the material hardens when quenched at different cooling rates. It is measured quantitatively, usually by noting the extent or depth of hardening of a standard size and shape test specimen in a standardized quench. In the “end-quench” test the “depth of hardening” is the distance along the specimen from the quenched end to a given hardness.

## 4. Ordering Information

4.1 Orders for material under this specification should include the following information, in proper sequence:

4.1.1 Quantity (weight),

4.1.2 Name of material (alloy, carbon, or carbon-boron steel),

4.1.3 Cross-sectional shape,

4.1.4 Size,

4.1.5 Length,

4.1.6 Grade,

4.1.7 End-quenched hardenability (see Section 9),

4.1.8 Report of heat analysis, if desired (see Section 7),

4.1.9 Special straightness, if required,

4.1.10 ASTM designation and date of issue,

4.1.11 End use or special requirements, and

4.1.12 Ledged steel, when required.

NOTE 1—A typical ordering description is as follows: 10 000 lb, alloy bars, round, 4.0 in. dia by 10 ft, Grade 1340H, J 40/56 =  $\frac{1}{16}$  in., heat analysis required, ASTM A 304, dated \_\_\_\_\_, worm gear.

4.2 The purchaser shall specify the desired grade, including the suffix letter “H,” in accordance with Table 1 or Table 2.

4.3 Band limits are shown graphically and as tabulations in Figs. 2-87, inclusive. For specifications purposes, the tabulated values of Rockwell C hardness are used. Values below 20 Rockwell C hardness (20 HRC) are not specified because such values are below the normal range of the C scale. The graphs are shown for convenience in estimating the hardness values obtainable at various locations on the end quench test bar and for various locations in oil or water quenched rounds. The relationship between end-quench distance and bar diameter is approximate and should be used only as a guide.

4.4 Two points from the tabulated values are commonly designated according to one of Methods A, B, C, D, or E, which are defined in the following paragraphs. Those various methods are illustrated graphically in Fig. 1.

4.4.1 *Method A*—The minimum and maximum hardness values at any desired distance. This method is illustrated in Fig. 1 as points A-A and would be specified as 43 to 54 HRC at J3.

<sup>1</sup> This specification is under the jurisdiction of ASTM Committee A01 on Steel, Stainless Steel, and Related Alloys and is the direct responsibility of Subcommittee A01.15 on Bars.

Current edition approved March 1, 2004. Published April 2004. Originally approved in 1947. Last previous edition approved in 2002 as A 304 – 02.

<sup>2</sup> For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For *Annual Book of ASTM Standards* volume information, refer to the standard's Document Summary page on the ASTM website.

\*A Summary of Changes section appears at the end of this standard.

Obviously the distance selected would be that distance on the end quench test bar which corresponds to the section used by the purchaser.

4.4.2 *Method B*—The minimum and maximum distances at which any desired hardness value occurs. This method is illustrated in Fig. 1 as points *B-B* and would be specified as 39 HRC at J4 minimum and J9 maximum. If the desired hardness does not fall on an exact sixteenth position, the minimum distance selected should be the nearest sixteenth position toward the quenched end and the maximum should be the nearest sixteenth position away from the quenched end.

4.4.3 *Method C*—Two maximum hardness values at two desired distances, illustrated in Fig. 1 as points *C-C*.

4.4.4 *Method D*—Two minimum hardness values at two desired distances, illustrated in Fig. 1 as points *D-D*.

4.4.5 *Method E*—Any minimum hardness plus any maximum hardness. When hardenability is specified according to one of the above Methods A to E, the balance of the hardenability band is not applicable.

4.5 In cases when it is considered desirable, the maximum and minimum limits at a distance of  $\frac{1}{16}$  in. from the quenched end can be specified in addition to the other two points as previously described in 4.4.1 to 4.4.5, inclusive.

4.6 In cases when it is necessary to specify more than two points on the hardenability band (exclusive of the maximum and minimum limits at a distance of  $\frac{1}{16}$  in.), a tolerance of two points Rockwell C (HRC) over any small portion of either curve (except at a distance of  $\frac{1}{16}$  in.) is customary. This tolerance is necessary because curves of individual heats vary somewhat in shape from the standard band limits and thus deviate slightly at one or more positions in the full length of the curves.

## 5. Manufacture

5.1 *Melting Practice*—The steel shall be made by one or more of the following primary processes: open-hearth, basic-oxygen, or electric-furnace. The primary melting may incorporate separate degassing or refining and may be followed by secondary melting using electroslag remelting or vacuum arc remelting. Where secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

5.2 *Slow Cooling*—Immediately after hot working, the bars shall be allowed to cool when necessary to a temperature below the critical range under suitable conditions, to prevent injury by too rapid cooling.

## 6. General Requirements

6.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 29/A 29M, unless otherwise provided for herein.

## 7. Chemical Composition

7.1 The heat analysis shall conform to the requirements as to chemical composition prescribed in Table 1 and Table 2 for the grade specified by the purchaser.

7.2 When a steel cannot be identified by a standard grade number in accordance with Table 1 and Table 2, other

compositions may be specified, as agreed upon between the purchaser and the manufacturer. Generally, hardenability bands will not be available for such compositions.

7.3 When requested by the manufacturer, and approved by the purchaser, other steels capable of meeting the purchaser's specified hardenability may be furnished in place of the grade specified by the purchaser.

## 8. Grain Size Requirements

8.1 The steel shall conform to the fine austenitic grain size requirement of Specification A 29/A 29M.

8.2 Hardenability values specified herein are based on fine-grain steels and are not applicable to coarse-grain material. In case coarse-grain steel is desired, the hardenability values shall be negotiated between the purchaser and the manufacturer.

## 9. End-Quench Hardenability Requirements

9.1 The end-quench hardenability shall conform to the requirements specified on the purchase order.

9.2 The hardenability values shall be specified in accordance with the applicable values in Figs. 2-87 inclusive for the grade specified. See Fig. 1 for method of specifying hardenability.

9.3 When agreed upon between the purchaser and manufacturer, special hardenability limits may be ordered and shall be reflected on the purchase order.

## 10. Test Specimens

10.1 *Number and Location*—The number and location of test specimens shall be in accordance with the manufacturer's standard practice and shall adequately represent the hardenability of each heat.

10.2 *Thermal Treatment*—All forged or rolled hardenability test specimens must be normalized prior to testing. Cast specimens need not be normalized.

## 11. Test Methods

11.1 *Grain Size*—Test Methods E 112.

11.2 *End-quench Hardenability*—Test Method A 255.

## 12. Certification and Reports of Testing

12.1 When the full H-band is specified for alloy steels, the hardenability can be reported by listing hardness values at the following distances from the quenched end of the test specimen: 1 through 16 sixteenths, then 18, 20, 22, 24, 28, and 32 sixteenths of an inch.

12.2 Tables 2-18 in Test Methods A 255 are to be used to calculate hardenability from the chemical ideal diameter for the grades shown in 10.1 of Test Methods A 255. Hardenability results are to be reported for the first 10 sixteenths (16 mm), then 12, 14, 16, 18, 20, 24, 28, and 32 sixteenths of an inch.

NOTE 2—The reporting hardenability using the calculated method differs from the procedure shown in 6.4 of Test Methods A 255.

12.3 For carbon H-steels, distances from the quenched end may be reported by listing sixteenths or half sixteenths (rather than full sixteenths only as with alloy steels). Units of sixteenths rather than thirty-seconds are followed for all steels

to avoid misunderstanding. When the full H-band is specified half sixteenths through 8 may be reported, as well as the distances listed in 12.1.

### 13. Keywords

13.1 alloy steel bars; carbon steel bars; end quench hardenability; steel bars

## SUMMARY OF CHANGES

Committee A01 has identified the location of selected changes to this specification since the last issue, A 304 - 96, that may impact the use of this specification.

(1) New section 12.2 added.

(2) Previous section 12.2 renumbered as 12.3.

**TABLE 1 Chemical Requirements of Alloy H Steels<sup>A</sup>**

NOTE 1—Phosphorus and sulfur in open-hearth steel is 0.035 %, max, and 0.040 %, max respectively. Phosphorus and sulfur in electric-furnace steel (designated by the prefix letter “E”) is 0.025 %, max.

NOTE 2—Small quantities of certain elements are present in alloy steels which are not specified or required. These elements are considered as incidental and may be present to the following maximum amounts: copper, 0.35 %; nickel, 0.25 %; chromium, 0.20 %; molybdenum, 0.06 %.

NOTE 3—Chemical ranges and limits shown in this table are subject to the permissible variation for product analysis shown in Specification A 29/A 29M.

NOTE 4—Standard “H” Steels can be produced with a lead range of 0.15–0.35 %. Such steels are identified by inserting the letter “L” between the second and third numerals of the grade designation, for example, 41L40H. Lead is generally reported as a range of 0.15–0.35 %.

<sup>A</sup>New designations established in accordance with Practice E 527 and SAE J 1086, Recommended Practice for Numbering Metals and Alloys (UNS).

<sup>B</sup>Sulfur content range is 0.035 to 0.050 %.

<sup>C</sup>These steels can be expected to have a 0.0005 % min boron content.

<sup>D</sup>Vanadium content range is 0.10 to 0.15 %.

<sup>E</sup>Minimum vanadium content is 0.15 %.

**TABLE 2 Chemical Requirements of Carbon H-Steels<sup>A</sup>**

UNS Designation <sup>B</sup>	Grade Designation	Chemical Composition, %				
		Carbon	Manganese	Phosphorus, max	Sulfur, max	Silicon
H 10380	1038 H	0.34–0.43	0.50–1.00	0.040	0.050	0.15–0.30

<sup>A</sup> Standard H Steels can be produced with a lead range of 0.15–0.35 %. Such steels are identified by inserting the letter “L” between the second and third numerals of the grade designation, for example, 15L22 H. Lead is generally reported as a range of 0.15–0.35 %.

<sup>B</sup> New designations established in accordance with Practice E 527 and SAE J 1086, Recommended Practice for Numbering Metals and Alloys (UNS).

<sup>C</sup>These steels can be expected to have 0.0005 % min boron content.
