## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## LOW-VOLTAGE SURGE PROTECTIVE DEVICES –

**Part 1: Surge protective devices connected  
to low-voltage power distribution systems –  
Requirements and tests**

## FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 61643-1 has been prepared by subcommittee 37A: Low-voltage surge protective devices, of IEC technical committee 37: Surge arresters.

This second edition of IEC 61643-1 cancels and replaces the first edition of IEC 61643-1, published 1998, Amendment 1 (2001) and corrigendum 1 (2003). This edition incorporates Amendment 2 which was not published separately due to the number of changes and pages

The document 37A/169/FDIS, circulated to the National Committees as amendment 2, led to the publication of this standard.

The text of this standard is based on the first edition of IEC 61643-1, its Amendment 1, its corrigendum 1 and on the following documents:

FDIS	Report of voting
37A/169/FDIS	37A/172/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The IEC TC 37, SC 37A and SC 37B have adopted a new numbering scheme for all IEC publications developed within these committees.

In this scheme, the IEC 61643 series of publications covers all the publications from SC 37A and SC 37B according to the table below with the common general title *Low-voltage surge protective devices*.

Publication No	Title	Present document
IEC 61643	Low-voltage surge protective devices	–

## iTeh STANDARD PREVIEW

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- reconfirmed; [SIST IEC 61643-1:2010](https://standards.iteh.ai/catalog/standards/sist/fe3e7012-38a2-4883-b0df-0c224d66acd4/sist-iec-61643-1-2010)
- withdrawn; <https://standards.iteh.ai/catalog/standards/sist/fe3e7012-38a2-4883-b0df-0c224d66acd4/sist-iec-61643-1-2010>
- replaced by a revised edition, or
- amended.

## INTRODUCTION

The present standard addresses performance tests for surge protective devices (SPDs).

There are three classifications of tests.

The class I test is intended to simulate partial conducted lightning current impulses. SPDs subjected to class I test methods are generally recommended for locations at points of high exposure, e.g., line entrances to buildings protected by lightning protection systems.

SPDs tested to class II or III test methods are subjected to impulses of shorter duration. These SPDs are generally recommended for locations with lesser exposure.

All SPDs are tested on a "black box" basis. Tests are included to assess techniques used by the manufacturers in order to apply the most appropriate test method.

Part 12 addresses the selection and application principles of SPDs in practical situations.

## LOW-VOLTAGE SURGE PROTECTIVE DEVICES –

### Part 1: Surge protective devices connected to low-voltage power distribution systems – Requirements and tests

## 1 General

### 1.1 Scope

This part of IEC 61643 is applicable to devices for surge protection against indirect and direct effects of lightning or other transient overvoltages. These devices are packaged to be connected to 50/60 Hz a.c. and d.c. power circuits, and equipment rated up to 1 000 V r.m.s. or 1 500 V d.c. Performance characteristics, standard methods for testing, and ratings are established for these devices that contain at least one nonlinear component that is intended to limit surge voltages and divert surge currents.

### 1.2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 61643-12:2002, *Low-voltage surge protective devices – Part 12: Surge protective devices connected to low-voltage power distribution systems – Selection and application principles*

## 2 Service conditions

### 2.1 Normal

**2.1.1 Frequency:** frequency of the supply mains is between 48 Hz and 62 Hz a.c.

**2.1.2 Voltage:** the voltage applied continuously between the terminals of the Surge Protective Device (SPD) must not exceed its maximum continuous operating voltage.

**2.1.3 Altitude:** altitude shall not exceed 2 000 m.

#### 2.1.4 Operating and storage temperatures

- normal range: –5 °C to +40 °C
- extended range: –40 °C to +70 °C

**2.1.5 Humidity – relative humidity:** under indoor temperature conditions shall be between 30 % and 90 %.

### 2.2 Abnormal

Exposure of the SPD to abnormal service conditions may require special consideration in the design or application of the SPD, and should be called to the attention of the manufacturer.

For outdoor SPDs exposed to solar or other radiation, additional requirements may be necessary.

## 3 Definitions

For the purpose of this part of IEC 61643, the following definitions apply.

### 3.1

#### Surge Protective Device SPD

device that is intended to limit transient overvoltages and divert surge currents. It contains at least one nonlinear component

### 3.2

#### one-port SPD

SPD connected in shunt with the circuit to be protected. A one port device may have separate input and output terminals without a specific series impedance between these terminals

**3.3****two-port SPD**

SPD with two sets of terminals, input and output. A specific series impedance is inserted between these terminals

**3.4****voltage switching type SPD**

SPD that has a high impedance when no surge is present, but can have a sudden change in impedance to a low value in response to a voltage surge. Common examples of components used as voltage switching devices are spark gaps, gas tubes, thyristors (silicon-controlled rectifiers) and triacs. These SPDs are sometimes called "crowbar type"

**3.5****voltage limiting type SPD**

SPD that has a high impedance when no surge is present, but will reduce it continuously with increased surge current and voltage. Common examples of components used as non-linear devices are varistors and suppressor diodes. These SPDs are sometimes called "clamping type"

**3.6****combination type SPD**

SPD that incorporates both voltage switching type components and voltage limiting type components may exhibit voltage switching, voltage limiting or both voltage switching and voltage limiting behaviour depending upon the characteristics of the applied voltage

**3.7****modes of protection**

SPDs protective component may be connected line-to-line or line-to-earth or line-to-neutral or neutral-to-earth and combinations thereof. These paths are referred to as modes of protection

**3.8****nominal discharge current**

$$I_n$$

crest value of the current through the SPD having a current waveshape of 8/20. This is used for the classification of the SPD for class II test and also for preconditioning of the SPD for class I and II tests

**3.9****impulse current**

$$I_{imp}$$

defined by three parameters, a current peak value  $I_{peak}$ , a charge  $Q$  and a specific energy  $W/R$ .

Note: This is used for the classification of the SPD for test class I

**3.10****maximum discharge current  $I_{max}$  for class II test**

crest value of a current through the SPD having an 8/20 waveshape and magnitude according to the test sequence of the class II operating duty test.  $I_{max}$  is greater than  $I_n$

**3.11****maximum continuous operating voltage**

$$U_c$$

maximum r.m.s. or d.c. voltage, which may be continuously applied to the SPD's mode of protection

**3.12****standby power consumption** $P_c$ 

power consumed by the SPD when energized at the maximum continuous operating voltage ( $U_c$ ) with balanced voltages and phase angles and no load. The SPD is connected in accordance with the manufacturer's instructions

**3.13****follow current** $I_f$ 

current supplied by the electrical power system and flowing through the SPD after a discharge current impulse. The follow current is significantly different from the continuous operating current  $I_c$

**3.14****rated load current** $I_L$ 

maximum continuous rated r.m.s. or d.c. current that can be supplied to a load connected to the protected output of an SPD

**3.15****voltage protection level** $U_p$ 

a parameter that characterizes the performance of the SPD in limiting the voltage across its terminals, which is selected from a list of preferred values. This value shall be greater than the highest value of the measured limiting voltages.

**3.16****measured limiting voltage**

the maximum magnitude of voltage that is measured across the terminals of the SPD during the application of impulses of specified waveshape and amplitude

**3.17****residual voltage** $U_{res}$ 

the peak value of voltage that appears between the terminals of an SPD due to the passage of discharge current

**3.18****temporary overvoltage test value** $U_T$ 

test voltage applied, for a specific duration, to the SPD to simulate the stress under TOV conditions

**3.19****load-side surge withstand capability for a two-port SPD**

ability of a two-port SPD to withstand surges on the output terminals originated in loads downstream of the SPD

**3.20****voltage drop (in per cent)**

$$\Delta U = ((U_{IN} - U_{OUT}) / U_{IN}) \times 100 \%$$

where

$U_{IN}$  is the input voltage and  $U_{OUT}$  is the output voltage measured simultaneously with a full rated resistive load connected. This parameter is only used for two-port SPDs.

**3.21****insertion loss**

at a given frequency, the insertion loss of an SPD connected into a given power system is defined as the ratio of voltages appearing across the mains immediately beyond the point of insertion before and after the insertion of the SPD under test. This result is expressed in decibels

NOTE Requirements and tests are under consideration.

**3.22****1,2/50 voltage impulse**

voltage impulse with a virtual front time of 1,2  $\mu$ s and a time to half-value of 50  $\mu$ s

Note 1 the front time is defined according to IEC 60060-1 to be  $1,67 \times (t_{90} - t_{30})$ , where  $t_{90}$  and  $t_{30}$  are the 90 % and 30 % points on the leading edge of the waveform;

Note 2 the time to half-value is defined as the time between the virtual origin and the 50 % point on the tail. The virtual origin is the point where a straight line, drawn through the 30 % and 90 % points on the leading edge of the waveform, intersects the  $U = 0$  line.

**3.23****8/20 current impulse**

current impulse with a virtual front time of 8  $\mu$ s and a time to half-value of 20  $\mu$ s

Note 1 the front time is defined according to IEC 60060-1 to be  $1,25 \times (t_{90} - t_{10})$ , where  $t_{90}$  and  $t_{10}$  are the 90 % and 10 % points on the leading edge of the waveform;

Note 2 the time to half-value is defined as the time between the virtual origin and the 50 % point on the tail. The virtual origin is the point where a straight line, drawn through the 10 % and 90 % points on the leading edge of the waveform, intersects the  $I = 0$  line.

**3.24****combination wave**

the combination wave is delivered by a generator that applies a 1,2/50 voltage impulse across an open circuit and an 8/20 current impulse into a short circuit. The voltage, current amplitude and waveforms that are delivered to the SPD are determined by the generator and the impedance of the SPD to which the surge is applied. The ratio of peak open-circuit voltage to peak short-circuit current is 2  $\Omega$ ; this is defined as the fictive impedance  $Z_f$ . The short-circuit current is symbolized by  $I_{sc}$ . The open-circuit voltage is symbolized by  $U_{oc}$

**3.25****thermal runaway**

operational condition when the sustained power dissipation of an SPD exceeds the thermal dissipation capability of the housing and connections, leading to a cumulative increase in the temperature of the internal elements culminating in failure

**3.26****thermal stability**

SPD is thermally stable if after the operating duty test causing temperature rise, the temperature of the SPD decreases with time when the SPD is energized at specified maximum continuous operating voltage and at specified ambient temperature conditions

**3.27****degradation**

change of original performance parameters as a result of exposure of the SPD to surge, service or unfavourable environment
