### Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 4126-2 was prepared by the European Committee for Standardization (CEN) in collaboration with Technical Committee ISO/TC 185, *Safety devices for protection against excessive pressure*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition of ISO 4126-2, together with that of ISO 4126-6, cancels and replaces ISO 6718:1991.

Throughout the text of this document, read "...this European Standard..." to mean "...this International Standard...".

ISO 4126 consists of the following Oparts dunder sthe generals title, Safety devices for protection against excessive pressure:

- Part 1: Safety valves
- Part 2: Bursting disc safety devices
- Part 3: Safety valves and bursting disc safety devices in combination
- Part 4: Pilot-operated safety valves
- Part 5: Controlled safety pressure relief systems (CSPRS)
- Part 6: Application, selection and installation of bursting disc safety devices
- Part 7: Common data

For the purposes of this part of ISO 4126, the CEN annex regarding fulfilment of European Council Directives has been removed.

<u>ISO 4126-2:2003</u> https://standards.iteh.ai/catalog/standards/sist/0fe2372e-f4d3-494a-a70a-0d6039d19465/iso-4126-2-2003

### Foreword

This document (EN ISO 4126-2:2003) has been prepared by Technical Committee CEN/TC 69 "Industrial valves", the secretariat of which is held by AFNOR, in collaboration with ISO/TC 185 "Safety devices for protection against excessive pressure".

This European Standard EN ISO 4126-2:2003 shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by July 2003, and conflicting national standards shall be withdrawn at the latest by July 2003.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association, and supports essential requirements of EU Directive(s).

This standard for safety devices for protection against excessive pressure consists of seven parts of which this is Part 2. The various parts are:

- Part 1: Safety valves.
- Part 2: Bursting disc safety devices.
- Part 3: Safety valves and bursting disc safety devices in combination. VIEW
- Part 4: Pilot operated safety valves. (standards.iteh.ai)
- Part 5: Controlled safety pressure relief systems (CSPRS).003 https://standards.iteh.ai/catalog/standards/sist/0fe2372e-f4d3-494a-a70a-
- Part 6: Application, selection and installation of bursting disc safety devices.
- Part 7: Common data.

Part 7 contains data that is common to more than one of the parts of this standard to avoid unnecessary repetition.

Annex A is normative. Annex B is informative.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Luxembourg, Malta, Netherlands, Norway, Portugal, Slovakia, Spain, Sweden, Switzerland and the United Kingdom.

### Introduction

A bursting disc safety device is a non-reclosing pressure relief device used to protect pressure equipment such as pressure vessels, piping, gas cylinders or other enclosures from excessive pressure and/or excessive vacuum.

A bursting disc safety device typically comprises an assembly of components including a bursting disc, a bursting disc holder and, where necessary, other components such as back pressure supports, stiffening rings etc.

The bursting disc is a pressure-containing and pressure-sensitive part of the bursting disc safety device and is designed to open by bursting at a pre-determined pressure. There are many different types of bursting disc safety devices manufactured in corrosion resistant materials, both metallic and non-metallic, to cover a wide range of nominal sizes, burst pressures and temperatures.

#### 1 Scope

This part of this European Standard specifies the requirements for bursting disc safety devices.

It includes the requirements for the design, manufacture, inspection, testing, certification, marking, and packaging.

The requirements for the application, selection and installation of bursting disc safety devices are given in Part 6 of this European Standard.

ASTM B708, Standard specification for tantalum and tantalum alloy, plate, sheet and strip.

#### 3 Terms and definitions

For the purposes of this European Standard, the following terms and definitions apply.

#### 3.1

#### bursting disc safety device

non-reclosing pressure relief device actuated by differential pressure and designed to function by the bursting of the bursting disc(s), and which is the complete assembly of installed components including, where appropriate, the bursting disc holder

#### 3.2

#### bursting disc assembly

complete assembly of components which are installed in the bursting disc holder to perform the desired function

#### 3.3

#### bursting disc

pressure-containing and pressure-sensitive component of a bursting disc safety device

#### 3.4

#### bursting disc holder

part of a bursting disc safety device which retains the bursting disc assembly in position

iTeh STANDARD PREVIEW

#### 3.5

#### conventional domed bursting disc (also referred to as: forward-acting)

bursting disc which is domed in the direction of the bursting pressure (i.e. where the bursting pressure is applied to the concave side of the bursting disc, see Figure 1).

#### 3.6

https://standards.iteh.ai/catalog/standards/sist/0fe2372e-f4d3-494a-a70a-0d6039d19465/iso-4126-2-2003

#### slotted lined bursting disc

bursting disc made up of two or more layers, at least one of which is slit or slotted to control the bursting pressure of the bursting disc

#### 3.7

#### reverse domed bursting disc (also referred to as: reverse-acting)

bursting disc which is domed against the direction of the bursting pressure (i.e. where the bursting pressure is applied to the convex side of the bursting disc, see Figure 2)

#### 3.8

#### flat bursting disc

bursting disc having one or more layers which is flat when installed. It may be made of a ductile or brittle material

#### 3.9

#### graphite bursting disc

bursting disc manufactured from graphite, impregnated graphite, flexible graphite or graphite composite and designed to burst due to bending or shearing forces

NOTE The following definitions apply:

- a) graphite. A crystalline form of the element carbon;
- b) **impregnated graphite.** Graphite in which the open porosity is impregnated with a filler material;
- c) **flexible graphite.** A graphite structure formed by the compression of thermally exfoliated graphite intercalation compounds;

d) **graphite composite.** Made up of two or more distinct materials and having different properties to those of the separate materials and in which the proportion of graphite is over 50 per cent by weight.

#### 3.10

#### bursting pressure

value of the differential pressure between the upstream side and the downstream side of the bursting disc when it bursts

#### 3.11

#### specified bursting pressure

bursting pressure quoted with a coincident temperature when defining the bursting disc requirements (used in conjunction with a performance tolerance, see 3.15)

#### 3.12

#### specified maximum bursting pressure

maximum bursting pressure quoted with a coincident temperature when defining the bursting disc requirements (used in conjunction with specified minimum bursting pressure, see 3.13)

#### 3.13

#### specified minimum bursting pressure

minimum bursting pressure quoted with a coincident temperature when defining the bursting disc requirements (used in conjunction with specified maximum bursting pressure, see 3.12)

#### 3.14

#### coincident temperature

temperature of the bursting disc associated with a burst pressure (see 3.11.3.12 and 3.13) and which is the expected temperature of the bursting disc when it is required to burst (standards.iteh.ai)

#### 3.15

#### performance tolerance

range of pressure between the specified minimum bursting pressure and the specified maximum bursting pressure, or the range of pressure in positive and negative percentages or quantities which is related to the specified bursting pressure (see Figure 9)

#### 3.16

#### operating pressure

pressure existing at normal operating conditions within the system being protected

#### 3.17

#### differential back pressure

differential pressure across a bursting disc in the opposite direction to the direction of the bursting pressure, which is the result of pressure in the discharge system from other sources and/or a result of vacuum on the upstream side of the bursting disc

#### 3.18

#### vent area

cross-section area available for discharge of fluid

#### 3.19

#### batch

quantity of bursting discs or bursting disc safety devices made as a single group of the same type, size, materials and specified bursting pressure requirements where the bursting discs are manufactured from the same lot of material (see 3.20)

#### 3.20

#### lot of material

a) **metal**. Material of the same specification coming from the same heat number, heat treatment batch and specified thickness with tolerances to an appropriate standard;

- b) **graphite and flexible graphite**. Material of the same specification grade and quality coming from the same graphite manufacturer and the same manufacturing process;
- c) **impregnated graphite**. Graphite of the same lot impregnated with a specific grade of filler material by the same manufacturing process;
- d) graphite composite. Graphite and specific grades of other constituents coming from the same mix

#### 3.21

#### back pressure support

component of a bursting disc safety device which prevents damage to the bursting disc due to differential back pressure

NOTE A back pressure support which is intended to prevent damage to the bursting disc when the system pressure falls below atmospheric pressure is sometimes referred to as a vacuum support.

#### 3.22

#### stiffening ring

component of a bursting disc assembly used primarily for reinforcing fragile bursting discs, so as to prevent damage

#### 3.23

#### coating

layer of metallic or non-metallic material applied to components of a bursting disc safety device by a coating process

# iTeh STANDARD PREVIEW

#### 3.24 linina

lining additional sheet or sheets of metallic or non-metallic material forming part of a bursting disc assembly or bursting disc holder

#### ISO 4126-2:2003

#### 0d6039d19465/iso-4126-2-2003

#### plating

metal layer applied to a bursting disc or bursting disc holder by a plating process

#### 3.26

3.25

muffled outlet

component of a bursting disc safety device which disperses the discharge

#### 3.27

#### temperature shield

device which protects a bursting disc from excessive temperature

#### 4 Materials

#### 4.1 Selection of materials

The selection of materials used for the components of bursting disc safety devices shall take into account:

a) suitability with regard to manufacture;

b) compatibility with the process fluid, the adjoining components and the chemical and physical conditions to which the bursting disc safety device will be subjected when in service.

NOTE The use of corrosion-resistant materials for the downstream side of the bursting disc device is recommended because corrosion of these parts can cause damage which can impair the performance of the bursting disc safety device.
