Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

International Standard ISO/IEC 2593 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6, *Telecommunications and information exchange between systems*.

This fourth edition cancels and replaces the third edition (ISO 2593:1993), of which it constitutes a minor revision.

Annex A forms a normative part of this International Standard.

Information technology — Telecommunications and information exchange between systems — 34-pole DTE/DCE interface connector mateability dimensions and contact number assignments

1 Scope

This International Standard specifies the 34-pole connector and the assignment of contact numbers at the interface between data terminal equipment (DTE) and data circuit-terminating equipment (DCE) where ITU-T Recommendation V.36 or Recommendation X.21bis together with Recommendation V.10 and V.11 are applicable.

NOTE 1 An interoperation between interfaces designed according to electrical characteristics specified in ITU-T Recommendation V.36 and those specified in ITU-T Recommendation V.11 is, at least to a limited degree, possible. This can be achieved, for example, by using a passive adaptor which joins the interface connectors in accordance with ISO/IEC 2593 and ISO 4902, or ISO 4903, respectively.

This International Standard specifies the dimensions of the connector housing and gives recommendations for the type of locking device (jack-screw system) and connector shielding.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this International Standard. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

3 Definitions

For the purposes of this International Standard, the definitions given in IEC 60050(581) apply. For the convenience of the users of this International Standard, the following definitions are repeated.

3.1 cable adaptor: A part of a connector or an accessory consisting of a rigid housing for attachment to the connector body. It may incorporate provision for a cable clamp or seal for terminating screens and provide shielding to electrical interference. It may be straight or angled.

3.2 connector housing: A part of a connector into which the insert and contacts are assembled.

3.3 contact arrangement: The number, spacing and configuration of contacts in a component.

3.4 female contact: A contact intended to make electrical engagement on its inner surface and which will accept entry of a male contact.

3.5 intermateable connectors: Two connectors are intermateable when they are capable of being connected electrically and mechanically but without regard to their performance and intermountability.

3.6 jack-screw system: A device comprising a set of captive screws and nuts used to couple and uncouple mating components. It may also provide a polarization facility.

3.7 locking device: A feature incorporated in certain components to provide mechanical retention of their mating part.

3.8 male contact: A contact intended to make electrical engagement on its outer surface and which will enter a female contact.

3.9 mounting flange: A projection from a component for the purpose of attaching the component to a rigid surface.

3.10 (n-pole-)connector: A component which terminates conductors for the purpose of providing connection and disconnection to a suitable mating component.

3.11 polarization: Features on mating components to prevent incorrect mating.

4 Connector Specifications

A 34-pole connector shall be provided for the DTE/DCE interface.

Figures 1 to 5 illustrate the 34-pole connector. Only those dimensions that are essential for mating are shown.

Figure 1 illustrates the DTE connector which has 34 male contacts in a connector housing. Figure 2 illustrates the DCE connector which has 34 female contacts in a connector housing. The connector housing on the DTE connector is dimensioned to fit inside the connector housing on the DCE connector (see figures 1 and 2). Contact identification lettering is also specified in figures 1 and 2. The use of shields and mounting flanges is illustrated in figures 1 and 2 respectively. Since their shape and size is not essential for mating, the use of different shape and size from those illustrated does not affect conformance with this International Standard.

Figure 3 illustrates the dimensions for the contact spacing.

Figures 4 and 5 illustrate the dimensions for the male and female contacts respectively.

Figures 8 and 9 illustrate the connector mountings.

The connectors shall be equipped with a jack-screw system (see figures 6 and 7 and tables 2 and 3). On the DTE connector, the female jack-screw (nut) shall be positioned adjacent to the male contact lettered A and the male jack-screw

iTeh STANDARD PREVIEW
 (standards.iteh.ai/catalog/standards/sist/3e2a110e-11c2-4311-aa33-2ad53aa8b410/iso-iec-2593-2000)

shall be positioned adjacent to the male contact lettered MM. Both jack-screws of the DTE connector shall be rotatable. On the DCE connector, the female jack-screw (nut) shall be positioned adjacent to the female contact lettered MM and the male jack-screw shall be positioned adjacent to the female contact lettered A. Both jack-screws of the DCE connector shall be fixed to prevent rotation.

Connectors shall use either the 6-32 UNC thread in accordance with the present specification of IEC 60807-6 or, if required by national regulations or mutual user agreement, M 3 as specified in ISO 261.

When procuring equipment internationally which will use this 34-pole connector, the user shall specify the thread type in accordance with national requirements.

NOTES

2 The nominal contact diameter of 1,6 mm is referred to as size 16 in IEC 60807-7.

3 The first edition of this International Standard did not specify all the connector dimensions required to ensure mechanical compatibility. As a result, contacts with nominal diameter of both 1 mm and 1,6 mm and two different arrangements of male shell and female shell and different dimensions of jack-screws are now in use in different countries. This International Standard

specifies 1,6 mm contacts and the particular arrangement of male shell and of female shell described above; where arrangements occur which do not conform with this edition, adaptors can be necessary.

4 The male shell specified in this International Standard does not contain the optional polarizing pin defined in IEC 60807-6.

5 Assignment of contact letters

The assignment of contact letters is given in table 1.

6 Connector shielding

Connector shielding is optional. If it is used, e.g. due to national regulations, etc., it shall be accomplished by use of

- a metallic male shell together with a connector housing and a cable adaptor with a DTE connector; or

- a metallic female shell with a DCE connector.

A polarization pin shall not be used on the male shell.

Table 1 – Assignment of contact numbers

| Contact | Function ¹⁾ | CCITT circuit number | Direction |
|---------|--|----------------------|-----------|
| A | See note 1 | – | – |
| B | Signal ground or common return | 102 | common |
| C | Request to send | 105 | from DTE |
| D | Ready for sending | 106 | to DTE |
| E | Data set ready | 107 | to DTE |
| F | Data channel received line signal detector | 109 | to DTE |
| H | Connect data set to line (see note 2) | 108/1 | from DTE |
| | Data terminal ready (see note 2) | 108/2 | from DTE |
| J | Calling indicator (see note 2) | 125 | to DTE |
| K | F ₁ | – | – |
| L | Local loopback (see note 2) | 141 | from DTE |
| M | F ₁ | – | – |
| N | Loopback/Maintenance test | 140 | from DTE |
| R | Received data A-wire | 104 | to DTE |
| T | Received data B-wire | 104 | to DTE |
| V | Receiver signal element timing (DCE source) A-wire | 115 | to DTE |
| X | Receiver signal element timing (DCE source) B-wire | 115 | to DTE |
| Y | Transmitter signal element timing (DCE source) A-wire | 114 | to DTE |
| AA | Transmitter signal element timing (DCE source) B-wire | 114 | to DTE |
| P | Transmitted data A-wire | 103 | from DTE |
| S | Transmitted data B-wire | 103 | from DTE |
| U | Transmitter signal element timing (DTE source) A-wire (see note 2) | 113 | from DTE |
| Z | F ₂ | – | – |
| W | Transmitter signal element timing (DTE source) B-wire (see note 2) | 113 | from DTE |
| BB | F ₂ | – | – |
| CC | F ₃ | – | – |
| DD | F ₄ | – | – |
| EE | F ₃ | – | – |
| FF | F ₄ | – | – |
| HH | N ₁ | – | – |
| JJ | N ₂ | – | – |
| KK | N ₁ | – | – |
| LL | N ₂ | – | – |
| MM | F | – | – |
| NN | Test indicator (see note 2) | 142 | to DTE |

NOTES

1 Contact A is assigned for connecting the shields between tandem sections of the shielded interface cable. The shield may be connected either to protective ground or to signal ground at either the DTE or the DCE or both in accordance with national regulations.

Signal ground may further be connected to protective ground in accordance with national safety regulations. Caution should be exercised to prevent establishment of ground loops carrying high currents.

2 These functions are not included in ITU-T Recommendation V.36 but where implemented on an optional basis the assigned contacts should be used.

1) Legend:

N = Contact permanently reserved for national use

F = Contact reserved for future Standardization purposes and should not be used for national use

Subscripts indicate contacts which may be associated to form pairs; for example, F₁ on contact K and M form a pair.
