## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this part of ISO 9735 may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 9735-5 was prepared by Technical Committee ISO/TC 154, *Processes, data elements and documents in commerce, industry and administration* in collaboration with UN/CEFACT through the Joint Syntax Working Group (JSWG).

This second edition cancels and replaces the first edition (ISO 9735-5:1999). However ISO 9735:1988 and its Amendment 1:1992 are provisionally retained for the reasons given in clause 2.

Furthermore, for maintenance reasons the Syntax service directories have been removed from this and all other parts of the ISO 9735 series. They are now consolidated in a new part, ISO 9735-10.

At the time of publication of ISO 9735-1:1998, ISO 9735-10 had been allocated as a part for "Security rules for interactive EDI". This was subsequently withdrawn because of lack of user support, and as a result, all relevant references to the title "Security rules for interactive EDI" were removed in this second edition of ISO 9735-5.

Definitions from all parts of the ISO 9735 series have been consolidated and included in ISO 9735-1.

ISO 9735 consists of the following parts, under the general title *Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules (Syntax version number: 4, Syntax release number: 1)*:

- *Part 1: Syntax rules common to all parts*
- *Part 2: Syntax rules specific to batch EDI*
- *Part 3: Syntax rules specific to interactive EDI*
- *Part 4: Syntax and service report message for batch EDI (message type — CONTRL)*
- *Part 5: Security rules for batch EDI (authenticity, integrity and non-repudiation of origin)*
- *Part 6: Secure authentication and acknowledgement message (message type — AUTACK)*
- *Part 7: Security rules for batch EDI (confidentiality)*
- *Part 8: Associated data in EDI*

- *Part 9: Security key and certificate management message (message type — KEYMAN)*
- *Part 10: Syntax service directories*

Further parts may be added in the future.

Annexes A to E of this part of ISO 9735 are for information only.

## **iTeh STANDARD PREVIEW (standards.iteh.ai)**

[OSIST ISO 9735-5:2004](https://standards.iteh.ai/catalog/standards/sist/168d9091-567c-4fb3-9def-2b49758122a5/osist-iso-9735-5-2004)

<https://standards.iteh.ai/catalog/standards/sist/168d9091-567c-4fb3-9def-2b49758122a5/osist-iso-9735-5-2004>

## Introduction

This part of ISO 9735 includes the rules at the application level for the structuring of data in the interchange of electronic messages in an open environment, based on the requirements of either batch or interactive processing. These rules have been agreed by the United Nations Economic Commission for Europe (UN/ECE) as syntax rules for Electronic Data Interchange for Administration, Commerce and Transport (EDIFACT) and are part of the United Nations Trade Data Interchange Directory (UNTDID) which also includes both batch and interactive Message Design Guidelines.

Communications specifications and protocols are outside the scope of this part of ISO 9735.

This is a new part, which has been added to ISO 9735. It provides an optional capability of securing batch EDIFACT structures, i.e. messages, packages, groups or interchange.

## iTeh STANDARD PREVIEW (standards.iteh.ai)

[OSIST ISO 9735-5:2004](https://standards.iteh.ai/catalog/standards/sist/168d9091-567c-4fb3-9def-2b49758122a5/osist-iso-9735-5-2004)

<https://standards.iteh.ai/catalog/standards/sist/168d9091-567c-4fb3-9def-2b49758122a5/osist-iso-9735-5-2004>

# Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules (Syntax version number: 4, Syntax release number: 1) —

Part 5:

## Security rules for batch EDI (authenticity, integrity and non-repudiation of origin)

### 1 Scope

This part of ISO 9735 specifies syntax rules for EDIFACT security. It provides a method to address message/package level, group level and interchange level security for authenticity, integrity and non-repudiation of origin, in accordance with established security mechanisms.

iTeh STANDARD PREVIEW  
(standards.iteh.ai)

### 2 Conformance

Whereas this part shall use a version number of “4” in the mandatory data element 0002 (Syntax version number), and shall use a release number of “01” in the conditional data element 0076 (Syntax release number), each of which appear in the segment UNB (Interchange header), interchanges continuing to use the syntax defined in the earlier published versions shall use the following Syntax version numbers, in order to differentiate them from each other and from this part:

- ISO 9735:1988 — *Syntax version number: 1*
- ISO 9735:1988 (amended and reprinted in 1990) — *Syntax version number: 2*
- ISO 9735:1988 and its Amendment 1:1992 — *Syntax version number: 3*
- ISO 9735:1998 — *Syntax version number: 4*

Conformance to a standard means that all of its requirements, including all options, are supported. If all options are not supported, any claim of conformance shall include a statement which identifies those options to which conformance is claimed.

Data that is interchanged is in conformance if the structure and representation of the data conform to the syntax rules specified in this part of ISO 9735.

Devices supporting this part of ISO 9735 are in conformance when they are capable of creating and/or interpreting the data structured and represented in conformance with this part of ISO 9735.

Conformance to this part of ISO 9735 shall include conformance to parts 1, 2, 8 and 10 of ISO 9735.

When identified in this part of ISO 9735, provisions defined in related standards shall form part of the conformance criteria.

### 3 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of ISO 9735. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of ISO 9735 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

ISO 9735-1:2002, *Electronic data interchange for administration, commerce and transport (EDIFACT) — Application level syntax rules (Syntax version number: 4, Syntax release number: 1) — Part 1: Syntax rules common to all parts*

### 4 Terms and definitions

For the purposes of this part of ISO 9735, the terms and definitions given in ISO 9735-1 apply.

## 5 Rules for the use of security header and trailer segment groups for batch EDI

### 5.1 Message/package level security — integrated message/package security

#### 5.1.1 General

The security threats relevant to message/package transmission and the security services which address them are described in annexes A and B.

This subclause describes the structure of EDIFACT message/package level security.

Security services addressed in this part of ISO 9735 shall be provided by the inclusion of security header and trailer segment groups after the UNH and before the UNT, in a way which shall be applied to any existing message, or after the UNO and before the UNP, for any existing package.

### 5.1.2 Security header and trailer segment groups

Figure 1 describes an interchange showing security at message level.

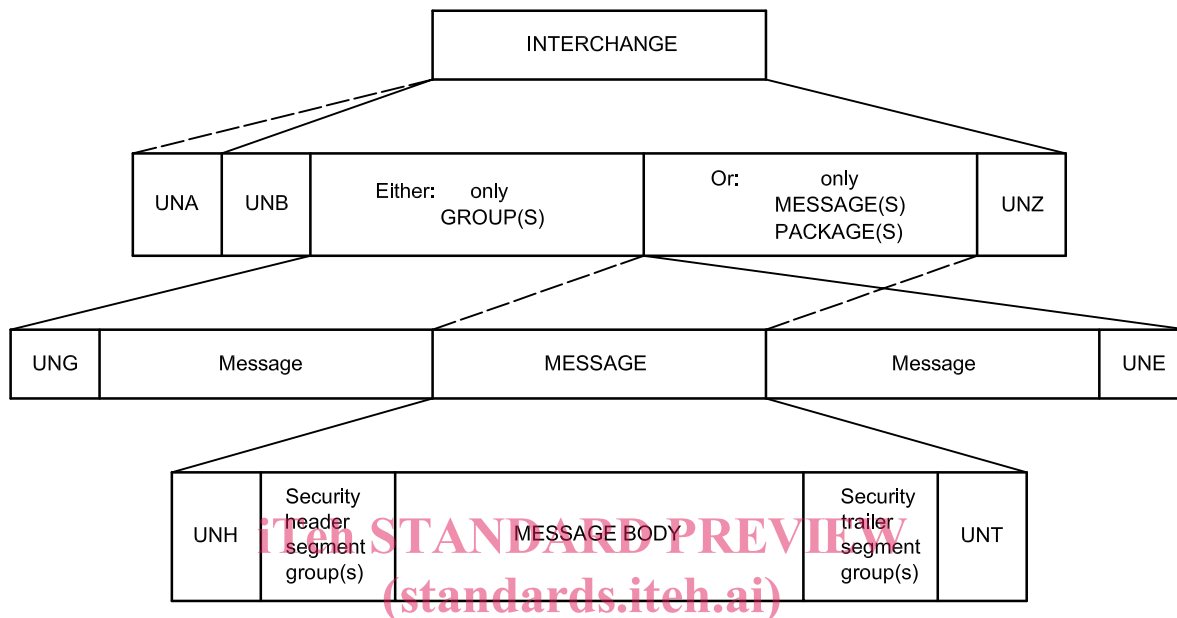

Figure 1 — Interchange showing security at message level (schematic)

OSIST ISO 9735-5:2004  
<https://standards.iteh.ai/catalog/standards/sist/168d9091-567c-4fb3-9def-2b49758122a5/osist-iso-9735-5-2004>

Figure 2 describes an interchange showing security at package level.

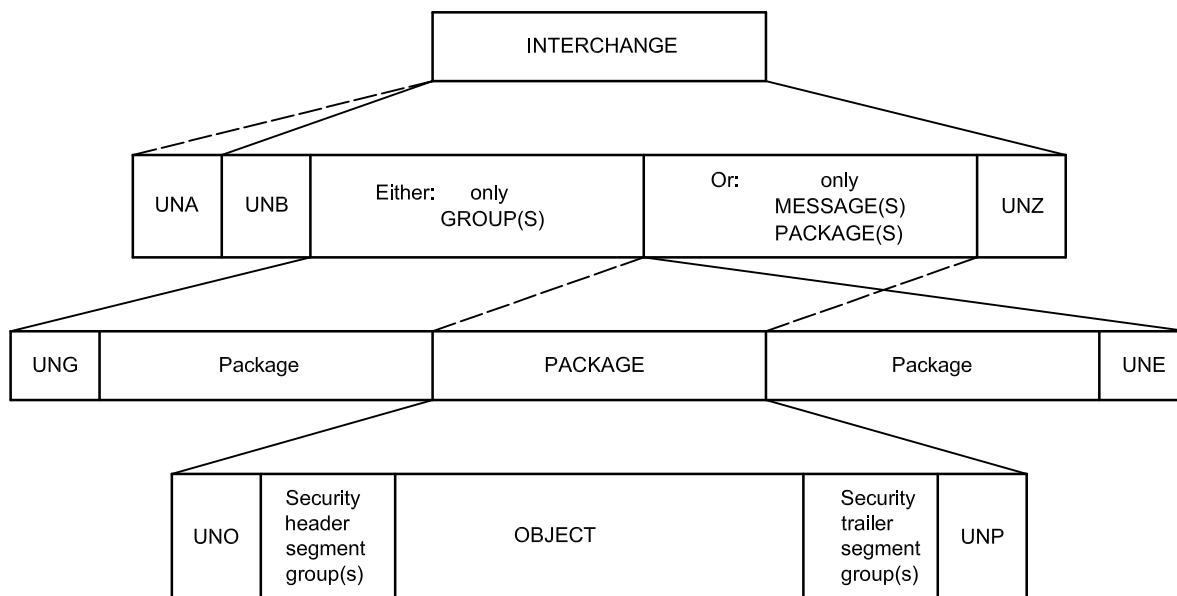

Figure 2 — Interchange showing security at package level (schematic)

5.1.3 Security header and trailer segment groups structure

Table 1 — Security header and security trailer segment groups segment table (message level security)

TAG	Name	S	R
UNH	Message Header	M	1
-----	Segment Group 1 -----	C	99 -----+
USH	Security Header	M	1 I
USA	Security Algorithm	C	3 I
-----	Segment Group 2 -----	C	2 -----+ I
USC	Certificate	M	1 I I
USA	Security Algorithm	C	3 I I
USR	Security Result	C	1 -----+
	Message body		
-----	Segment Group n -----	C	99 -----+
UST	Security Trailer	M	1 I
USR	Security Result	C	1 -----+
UNT	Message Trailer	M	1

Table 2 — Security header and security trailer segment groups segment table (package level security)

TAG	Name	S	R
UNO	Object Header	M	1
-----	Segment Group 1 -----	C	99 -----+
USH	Security Header	M	1 I
USA	Security Algorithm	C	3 I
-----	Segment Group 2 -----	C	2 -----+ I
USC	Certificate	M	1 I I
USA	Security Algorithm	C	3 I I
USR	Security Result	C	1 -----+
	Object		
-----	Segment Group n -----	C	99 -----+
UST	Security Trailer	M	1 I
USR	Security Result	C	1 -----+
UNP	Object Trailer	M	1

NOTE The complete directory specification of the segments and data elements, including segments UNH message header, UNT message trailer, UNO object header and UNP object trailer are specified in ISO 9735-10. They are not described further in this part of ISO 9735.

5.1.4 Data segment clarification

Segment Group 1: USH-USA-SG2 (security header group)

A group of segments identifying the security service and security mechanisms applied and containing the data necessary to carry out the validation calculations.

There may be several different security header segment groups within the same message/package, if different security services are applied to the message/package (e. g. integrity and non-repudiation of origin) or if the same security service is applied by several parties.

USH, Security header

A segment specifying a security service applied to the message/package in which the segment is included.

The parties involved in the security service (security elements originator and security elements recipient), may be identified in this segment, unless they are unambiguously identified by means of certificates (USC segment) when asymmetric algorithms are used.

Security identification details composite data element (S500) shall be used in USH segment either:

- if symmetric algorithms are used, or
- if asymmetric algorithms are used and when two certificates are present, in order to distinguish between the originator and the recipient certificates

In this latter case, the identification of the party in S500 (any of the data elements S500/0511, S500/0513, S500/0515, S500/0586) shall be the same as the identification of the party, qualified as “certificate owner” in one of the S500 present in the USC segment in segment group 2, and data element S500/0577 shall identify the function (originator or recipient) of the party involved.

Data element key name in security identification details composite data element (S500/0538) may be used to establish the key relationship between the sending and receiving parties.

This key relationship may also be established by using the data element identification of the key of the algorithm parameter composite data element (S503/0554) in the USA segment of segment group 1.

S500/0538 in USH segment may be used if there is no need to convey a USA segment in segment group 1 (because the cryptographic mechanisms have been agreed previously between the partners).

Nevertheless, it is strongly recommended to use either S500/0538 in the USH segment, or S503/0554 with the appropriate qualifier in the USA segment, but not both of them, within the same security header group.

USH segment may specify the filter function used for the binary fields of USA segment within segment group 1 and of the USR segment of the corresponding security trailer group.

USH segment may include a security sequence number to provide sequence integrity, and the date of creation of the security elements.

### USA, Security algorithm

A segment identifying a security algorithm, the technical usage made of it, and containing the technical parameters required. This shall be the algorithm applied directly on the message/package. This algorithm may be either symmetric, a hash function or a compression algorithm. For example, for a digital signature, it indicates the message-dependent hash function to be used.

Asymmetric algorithms shall not be referred to directly in this USA segment within segment group 1 but may appear only within segment group 2, triggered by a USC segment.

Three occurrences of the USA segment are allowed. One occurrence shall be used for the symmetric algorithm or the hash function required to provide the security service specified in the USH segment. The other two occurrences are described in ISO 9735-7.

Indication of padding mechanism may be used when appropriate.

### Segment Group 2: USC-USA-USR (certificate group)

A group of segments containing the data necessary to validate the security methods applied to the message/package, when asymmetric algorithms are used. Certificate segment group shall be used when asymmetric algorithms are used to identify the asymmetric key pair used, even if certificates are not used.

Either the full certificate segment group (including the USR segment), or the only data elements necessary to identify unambiguously the asymmetric key pair used, shall be present in the USC segment. The presence of a full
