Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 22762-1 was prepared by Technical Committee ISO/TC 45, *Rubber and rubber products*, Subcommittee SC 4, *Products (other than hoses)*.

ISO 22762 consists of the following parts, under the general title *Elastomeric seismic-protection isolators*:

standards.iteh.ai)

- Part 1: Test methods
- Part 2: Applications for bridges Specifications https://standards.iteh.al/catalog/standards/sist/cfee7159-34aa-4322-8db9-
- Part 3: Applications for buildings Specifications

Introduction

This International Standard contains two parts related to specifications for isolators — one for bridges and the other for buildings — since the requirements for isolators for bridges and for buildings are quite different, although the basic concept of the two products is similar. Therefore, when this International Standard is applied to the design of bridge isolators, Part 2 and the relevant clauses in Part 1 are used and, when it is applied to building isolators, Part 3 and the relevant clauses in Part 1 are used.

The main differences to be noted between isolators for bridges and isolators for buildings are as below:

- Isolators for bridges are mainly rectangular in shape and those for buildings circular in shape. a)
- Isolators for bridges are designed to be used for both rotation and horizontal displacement, while isolators b) for buildings are designed for horizontal displacement only.
- Isolators for bridges are designed to perform on a daily basis to accommodate length changes of bridges C) caused by temperature changes as well as during earthquakes, while isolators for buildings are designed to perform only during earthquakes.
- Isolators for bridges are designed to withstand dynamic loads caused by vehicles on a daily basis as well d) as earthquakes, while isolators for buildings are mainly designed to withstand dynamic loads caused by earthquakes only.

For structures that are neither buildings nor bridges (e.g. tanks), the structural engineer may use either Part 2 or Part 3 of this International Standard, depending on the requirements of the structure.

iTeh STANDARD PREVIEW (standards.iteh.ai)

<u>ISO 22762-1:2005</u> https://standards.iteh.ai/catalog/standards/sist/cfee7159-34aa-4322-8db9d72856f26e83/iso-22762-1-2005

Elastomeric seismic-protection isolators —

Part 1: Test methods

1 Scope

ISO 22762 applies to elastomeric seismic isolators used to provide buildings or bridges with protection from earthquake damage. The isolators covered consist of alternate rubber layers and reinforcing steel plates. They are placed between a superstructure and its substructure to provide both flexibility for decoupling structural systems from ground motion, and damping capability to reduce displacement at the isolation interface and the transmission of energy from the ground into the structure at the isolation frequency.

This part of ISO 22762 specifies the test methods for determination of the characteristics of elastomeric seismic isolators and for measurement of the properties of the rubber material used in their manufacture.

The specifications cover testing for all properties required in the elastomeric isolators, such as compression and shear properties, the durability of the isolators and the physical properties of the materials used in isolators.

Annex E may be used to review those requirements needing confirmation prior to the test programme.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

3.2

breaking

buckling

(standards.iteh.ai)

rupture of elastomeric isolator due to compression (or tension)-shear loading

ISO 22762-1:2005

https://standards.iteh.ai/catalog/standards/sist/cfee7159-34aa-4322-8db9-

d72856f26e83/iso-22762-1-2005

state when elastomeric isolators lose their stability under compression-shear loading

3.3

compressive properties of elastomeric isolator

compressive stiffness (K_v) for all types of rubber bearings

3.4

compressive-shear testing machine

machine used to test elastomeric isolators, which has the capability of shear loading under constant compressive load

3.5

cover rubber

rubber wrapped around the outside of inner rubber and reinforcing steel plates before or after curing of elastomeric isolators for the purpose of protecting the inner rubber from deterioration due to oxygen, ultraviolet rays and other natural elements and protecting the reinforcing plates from corrosion

3.6

design compressive stress

long term compressive force on the elastomeric isolator imposed by the structure

3.7

effective loaded area

area sustaining vertical load in elastomeric isolators, which corresponds to the area of reinforcing steel plates

3.8

effective width

 $\langle rectangular \ elastomeric \ isolator \rangle$ the smaller of the two side lengths of inner rubber to which direction shear displacement is not restricted

3.9

elastomeric isolator

rubber bearing, for seismic isolation of buildings, bridges and other structures, which consists of multi-layered vulcanized rubber sheets and reinforcing steel plates

NOTE Types of such isolators include high-damping rubber bearings, linear natural rubber bearings and lead rubber bearings.

3.10

first shape factor

ratio of effectively loaded area to free deformation area of one inner rubber layer between steel plates

3.11

high-damping rubber bearing HDR

elastomeric isolator with relatively high damping properties obtained by special compounding of the rubber and the use of additives

3.12

inner rubber

rubber between multi-layered steel plates inside an elastomeric isolator

3.13

lead rubber bearing LRB

elastomeric isolator whose inner rubber with a fead plug or lead plug press fitted into a hole or holes of the isolator body to achieve damping properties og/standards/sist/cfee7159-34aa-4322-8db9d72856f26e83/iso-22762-1-2005

(standards.iteh.ai)

3.14

linear natural rubber bearing

LNR

elastomeric isolator with linear shear force-deflection characteristics and relatively low damping properties and fabricated using natural rubber

NOTE Any bearing with relatively low damping may be treated as an LNR bearing for the purposes of isolator testing.

3.15

maximum compressive stress

maximum compressive stress acting briefly on elastomeric isolators during an earthquake

3.16

nominal compressive stress

long-term compressive stress recommended by the manufacturer for the isolator, including the safety margin

3.17

roll-out

instability of an isolator with either dowelled or recessed connection under shear displacement

3.18

routine test

a test for quality control of the production isolators during and after manufacturing

3.19

second shape factor

(circular elastomeric isolator) ratio of the diameter of the inner rubber to the total thickness of the inner rubber

(rectangular or square elastomeric isolator) ratio of the effective width of the inner rubber to the total thickness of the inner rubber

3.20

shear properties of elastomeric isolators

a comprehensive term that covers characteristics determined from isolator tests:

shear stiffness (K_h) for LNR;

- shear stiffness (K_{h}) and equivalent damping ratio (h_{eq}) for HDR and LRB;
- post-yield stiffness (K_d) and characteristic strength (Q_d) for LRB.

3.21

structural engineer

engineer who is in charge of designing of structure for base-isolated bridges or buildings and is responsible for specifying the requirements for elastomeric isolators

3.22

type test

test for verification either of material properties and isolator performances during development of the product or that project design parameters are achieved (standards.iteh.ai)

3.23

ultimate properties

ISO 22762-1:2005 properties at either buckling, breaking, or roll-out of an isolator under compression-shear loading

3.24

ultimate property diagram UPD

diagram giving the interaction curve of compressive stress and buckling strain or breaking strain of an elastomeric isolator

d72856f26e83/iso-22762-1-2005

Symbols and abbreviated terms 4

For the purposes of all three parts of ISO 22762, the symbols given in Table 1 apply.

Table 1 — Symbols and definitions
