Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://ipr.etsi.org>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This European Standard (EN) has been produced by ETSI Technical Committee Aeronautics (AERO).

The present document is part 1 of a multi-part deliverable covering VHF air-ground Digital Link (VDL) Mode 2; Technical characteristics and methods of measurement for ground-based equipment, as identified below:

Part 1: "Physical layer and MAC sub-layer";

Part 2: "Upper layers";

Part 3: "Harmonized EN covering the essential requirements of article 3.2 of the R&TTE Directive".

iTeh STANDARD PREVIEW

Date of withdrawal of any conflicting National Standard (dow):	31 January 2016

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Introduction

The present document states the technical specifications for ground-based equipment implementing Very High Frequency (VHF) Digital Link (VDL) Mode 2 air interface, operating in the VHF band (117,975 MHz to 137,000 MHz) with 25 kHz channel spacing.

Manufacturers should note that in the future, all or part of the frequency band 108,000 MHz to 117,975 MHz may become available for aeronautical communications.

The VDL Mode 2 system is designed to be a Ground/Air sub-system of the Aeronautical Telecommunication Network (ATN) using the AM(R)S band and it is organized according to the Open Systems Interconnection (OSI) model (defined by ISO). It will provide reliable subnetwork services to the ATN system.

The present document may be used to produce tests for the assessment of the performance of the equipment.

1 Scope

The present document applies to VDL Mode 2 ground-air digital communications using Differential Eight Phase Shift Keying (D8PSK), intended for channel increments of 25 kHz. The VDL Mode 2 system provides data communication exchanges between aircraft and ground-based systems. The scope of the present document is limited to ground-based stations.

The present document provides functional specifications for ground-based radio equipment intended to be used for ground-air data communications. The present document is derived from the following documents:

- Annex 10 of the ICAO Convention on International Civil Aviation [1].
- ED 92B [i.2]: "MOPS for an Airborne VDL Mode-2 Transceiver Operating in the frequency range 118-136.975 MHz" (2012), which specifies the airborne transceiver.

The present document consists of two parts:

- the first part provides functional specifications and test procedures for physical layer and MAC sub-layer;
- the second part provides functional specifications and test procedures for link and sub-network access layers.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the reference document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

3 Definitions and abbreviations

3.1 Definitions *iTeh STANDARD PREVIEW*

3.1.1 Basic reference model definitions (standards.iteh.ai)

The present document is based on the concepts developed in the open systems interconnect basic reference model and makes use of the following terms defined in [ISO/IEC 7498-1 \[i.5\]: 1.4.1.2015](https://standards.iteh.ai/catalog/standards/sist/2686c53b-2a25-4148-842e-94aad6dc0f8b/sist-en-301-841-1-v1-4-1-2015)

<https://standards.iteh.ai/catalog/standards/sist/2686c53b-2a25-4148-842e-94aad6dc0f8b/sist-en-301-841-1-v1-4-1-2015>

- layer;
- sublayer;
- entity;
- service;
- service access point;
- service data unit;
- physical layer;
- data link layer.

3.1.2 Service conventions definitions

For the purposes of the present document, the terms and definitions given in ISO/IEC 10731 [i.6] apply:

- service provider;
- service user;
- service primitive;
- request;
- indication;
- confirm.

3.1.3 General definitions

For the purposes of the present document, the following terms and definitions apply:

adjacent channel power: amount of the modulated RF signal power transmitted outside of the assigned channel

NOTE: Adjacent channel power includes discrete spurious, signal sidebands, and noise density (including phase noise) at the transmitter output.

adjacent channel rejection: receiver's ability to demodulate the desired signal and meet the uncorrected BER requirement in the presence of an interfering signal in an adjacent channel

NOTE: The ratio (in dB) between the adjacent interfering signal level and the desired signal level necessary to achieve the specified minimum uncorrected BER, is the adjacent channel rejection (ACR) ratio.

aeronautical mobile service: mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate

average transmitter output power: average power supplied to the antenna transmission line by a transmitter during an interval of time sufficiently long, compared with the lowest frequency encountered in the modulation, taken under normal operating conditions

Bit Error Rate (BER): ratio between the number of erroneous bits received and the total number of bits received

NOTE: The uncorrected BER represents the BER without the benefit of Forward Error Correction (FEC).

Co-Channel Interference (CCI): capability of a receiver to demodulate the desired signal and achieve the minimum specified BER performance in the presence of an unwanted signal at the same assigned channel

NOTE: The ratio (in dB) between the wanted signal level and the unwanted signal level is the co-channel interference ratio.

iTeh STANDARD PREVIEW
(standards.iteh.ai)

conducted measurements: measurements which are made using a direct rf connection to the equipment under test

SIST EN 301 841-1 V1.4.1:2015

ground base station: aeronautical station equipment, in the aeronautical mobile service, for use with an external antenna and intended for use at a fixed location

https://standards.iteh.ai/catalog/standards/sist-en-301-841-1-v1-4-1-2015-94aad0dc0f8b/sist-en-301-841-1-v1-4-1-2015

spurious emissions: conducted rf emissions on a frequency or frequencies which are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information

NOTE: Spurious emissions include parasitic emissions, intermodulation products and frequency conversion products.

X 25: ITU-T standard for the protocols and message formats that define the interface between a terminal and a packet switching network

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

AC	Alternating Current
ACP	Adjacent Channel Protection
ACR	Adjacent Channel Rejection
AGC	Automatic Gain Control
AM(R)S	Aeronautical Mobile (Route) Service
ATN	Aeronautical Telecommunication Network
AVL	Aviation VHF Link
AVLC	Aviation VHF Link Control
AVLC_LI	Aviation VHF Link Control Length Indicator
AVPL	Aviation VHF Physical Layer
AVPL-Header	AVPL Header and training sequence
AVPL-TBS	AVPL Transmitted Bit Scrambled sequence
AVPL-THeader	AVPL Transmission Header sequence
AVPL-THI	AVPL Transmitted Header appended and Interleaved sequence
AVPL-TIRS	AVPL Transmitted Interleaved RS encoded sequence

AVPL-TTS	AVPL Transmitted Ternary Symbol sequence
AWG	Arbitrary Waveform Generator
BER	Bit Error Rate
CCI	Co Channel Interference
CRC	Cyclic Redundancy Check
CSMA	Carrier Sense Multiple Access
CW	Continuous Wave
D8PSK	Differentially encoded 8 Phase Shift Keying
dBc	Decibels relative to the carrier
dBm	Decibels relative to 1 milliwatt
DLS	Data Link Service
ED	Eurocae Document
EVM	Error Vector Magnitude
FCS	Frame Check Sequence
FEC	Forward Error Correction
FM	Frequency Modulation
HDLC	High-level Data Link Control
ICAO	International Civil Aviation Organization
IF	Intermediate Frequency
ISO	International Organization for Standardization
LME	Link Management Entity
MAC	Media Access Control
MOPS	Minimum Operational Performance Specification
OSI	Open Systems Interconnection
PC	Personal Computer
ppm	parts per million
RF	Radio Frequency
RMS	Root Mean Square
RS	Reed-Solomon
RSSI	Received Signal Strength Indicator
SAP	Service Access Point
SARPS	Standards And Recommended Practices (ICAO) 2015
SNACP	SubNetwork Access Protocol
SQP	Signal Quality Parameter
TIRS matrix	Transmission Interleaver and RS encoding matrix
VDL	VHF Digital Link
VHF	Very High Frequency
VME	VDL Management Entity
VSA	Vector Signal Analyser
VSWR	Voltage Standing Wave Radio

ITEH STANDARD PREVIEW (standards.iteh.ai)

4 General architecture of VDL Mode 2

The general architecture of the VHF radio equipment operating in VDL Mode 2 is depicted in figure 1. This figure presents the different functional parts of the VDL Mode 2 equipment.

The VDL system is related to the three lower layers of the OSI model providing services described as follows:

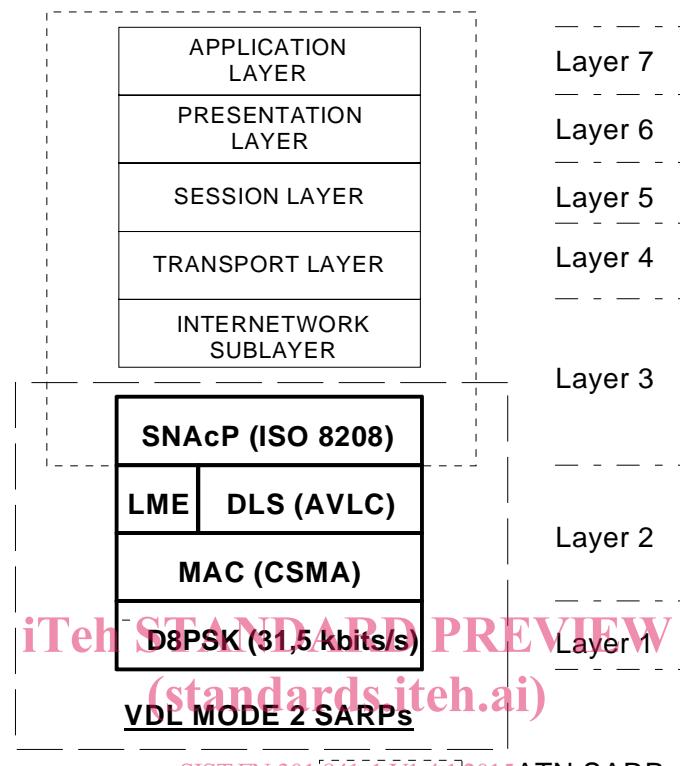

Layer 1 (Physical layer): provides transceiver frequency control, bit exchanges over the radio media, and notification functions. These functions are often known as radio and modulation functions. The physical layer handles information exchanges at the lowest level and manipulates bits. The physical layer handles modulation, data encoding and includes a forward error correction mechanism based on interleaving and Reed Solomon coding.

Layer 2 (Link Layer): is split into two sublayers and a link management entity:

- The MAC sublayer provides access to the Physical layer by a CSMA algorithm in charge of channel access. The MAC layer controls channel access and sharing.
- The DLS sublayer is composed of the AVLC derived from the HDLC protocol (ISO/IEC 13239 [i.3]) whose main functions are frame exchanges, frame processing, and error detection.
- The LME controls the link establishment and maintenance between DLS sublayers.

Layer 3: Only the lowest network sublayer of layer 3 (SNAcP) will be described in ETSI EN 301 841-2 [i.1]. It is compliant with the subnetwork sublayer requirements defined in the ATN SARPs and conforms with the ISO/IEC 8208 [i.4] (or network layer of X.25). It provides packet exchanges over a virtual circuit, error recovery, connection flow control, packet fragmentation, and subnetwork connection management functions.

The DLS and LME part of the Layer 2 and Layer 3 are specified in ETSI EN 301 841-2 [i.1].

5 Physical layer protocols and services functional specifications

5.1 Overview

The ground stations shall access the physical layer operating in simplex mode.

5.1.1 Functions

The tasks of the physical layer include the following:

- to modulate and demodulate radio carriers with a bit stream of a defined instantaneous rate to create an rf link;
- to acquire and maintain bit and burst synchronization between Transmitters and Receivers;
- to transmit or receive a defined number of bits at a requested time (packet mode) and on a particular carrier frequency;
- to add and remove a training sequence;
- to encode and decode the Forward Error Correction scheme;
- to measure received signal strength;
- to decide whether a channel is idle or busy, for the purposes of managing channel access attempts;

- to offer a notification service about the quality of link.

5.1.2 Data reception by the receiver

The receiver shall decode input signals and forward them to the higher layers for processing.

5.1.3 Data transmission

The VDL physical layer shall appropriately encode the data received from the data link layer and transmit it over the rf channel.

5.2 Transmission procedure

To transmit a sequence of frames, a station shall insert the bit numbers and, compute the FEC, interleave, insert the training sequence, carry out bit scrambling, and finally encode and modulate the rf signal. See figure 2.

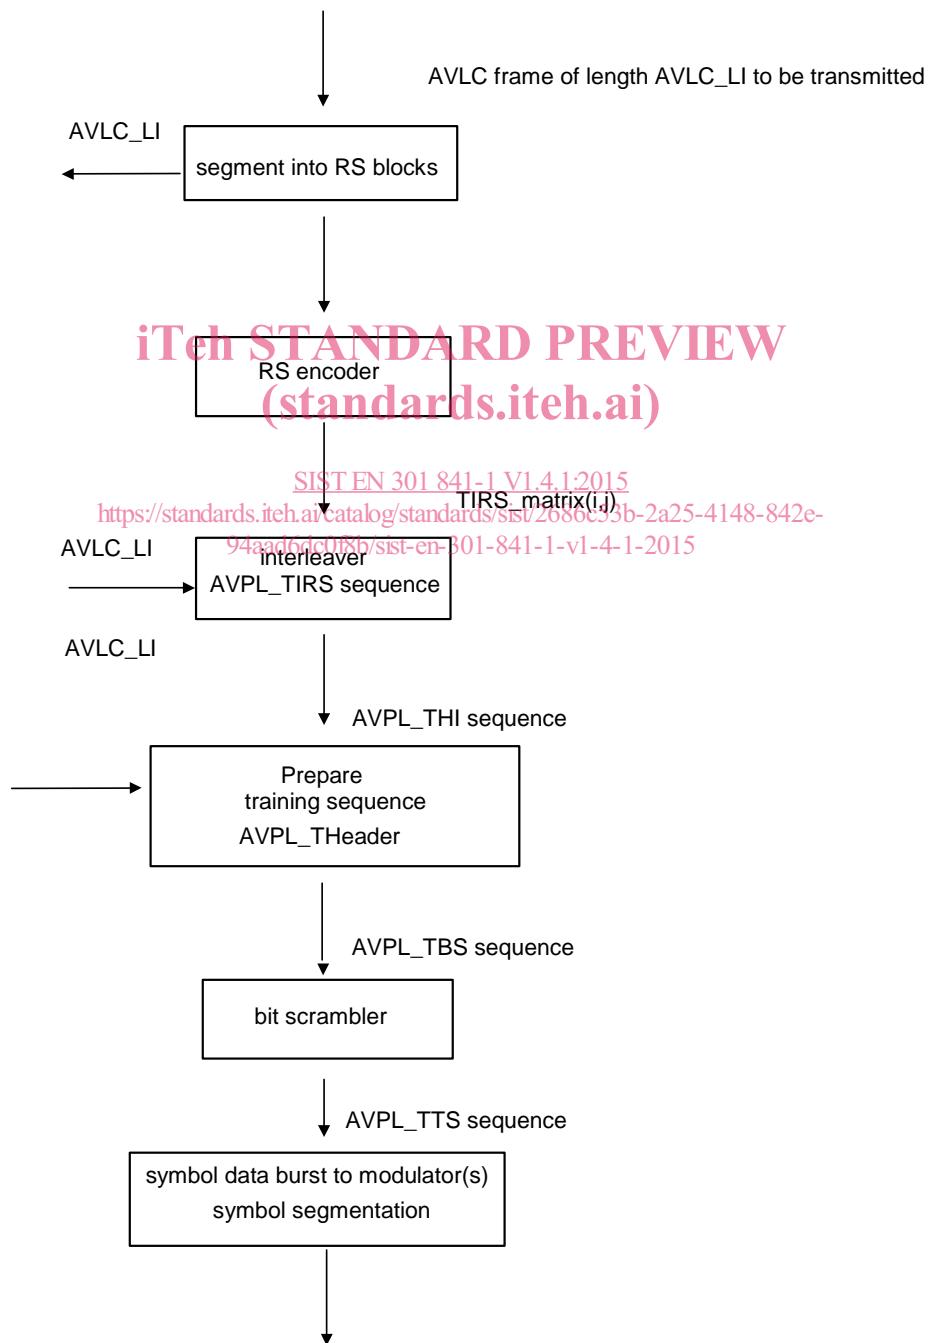

Figure 2: Data burst formatting procedure

5.3 Modulation scheme

Mode 2 shall use D8PSK, using a raised cosine filter with $\alpha = 0,6$ (nominal value). The information to be transmitted shall be differentially encoded with 3 bits per symbol transmitted as changes in phase rather than absolute phase. The data stream to be transmitted shall be divided into groups of 3 consecutive data bits, with the least significant bit first. Zeros shall be padded to the end of the transmissions if needed for the final channel symbol.

5.4 Training sequence

Data transmission shall begin with a demodulator training sequence consisting of five segments:

- transmitter ramp up and power stabilization (5 symbols);
- synchronization and ambiguity resolution (16 symbols - the "unique word");
- reserved symbol (1 symbol);
- transmission length (a single 17 bit word);
- header FEC (5 bits).

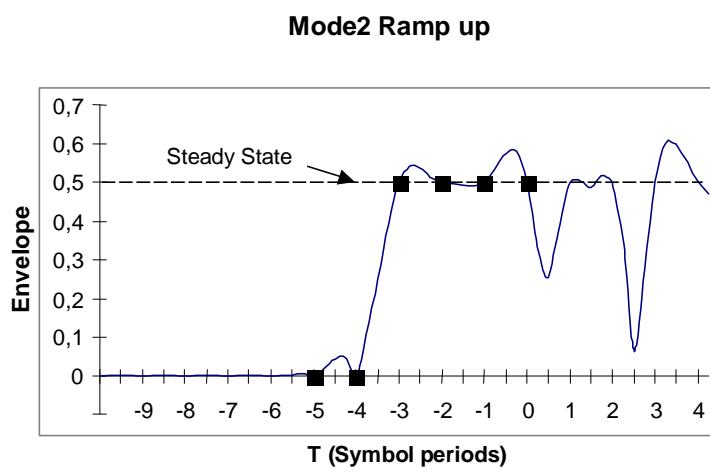

NOTE: Immediately after these segments there is an AVLC frame. See also figure 3 below.

transmitter power stabilization sequence	synchronization and ambiguity sequence	reserved symbol	transmission length (AVLC_LI)	header FEC
--	--	-----------------	-------------------------------	------------

5.4.1 RF power rise time definition

The purpose of the first segment of the training sequence, called the ramp-up, is to provide for transmitter power stabilization and receiver AGC settling and it shall immediately precede the first symbol of the unique word. The first segment also provides AGC settling time for the intended receiver. The time reference point (T), for the following specification is the centre of the first unique word symbol, a point that occurs 1/2 a symbol period after the end of the first segment. The start of the first segment is therefore defined at time T = -5,5 symbol periods.

Key: ■ Symbol increment
