Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

In exceptional circumstances, the joint technical committee may propose the publication of a Technical Report of one of the following types:

- type 1, when the required support cannot be obtained for the publication of an International Standard, despite repeated efforts;
- type 2, when the subject is still under technical development or where for any other reason there is the future but not immediate possibility of an agreement on an International Standard;
- type 3, when the joint technical committee has collected data of a different kind from that which is normally published as an International Standard ("state of the art", for example).

Technical Reports of types 1 and 2 are subject to review within three years of publication, to decide whether they can be transformed into International Standards. Technical Reports of type 3 do not necessarily have to be reviewed until the data they provide are considered to be no longer valid or useful.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC TR 19764, which is a Technical Report of type 3, was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 35, *User interfaces*.

Introduction

A successful information technology product or service requires satisfying the needs of users, including needs of a cultural and linguistic nature, which some people consider an essential part of what is now known as "[user]" accessibility [to information technology].

This Technical Report (TR) will assist the marketplace by providing an objective evaluation method to measure cultural and linguistic adaptability. Although local or national requirements of a legal and regulatory nature may not always be directly relevant in evaluation of products meeting cultural and linguistic adaptability, they sometimes constitute a world-wide challenge for many products or services, now including those which are IT-based. The TR provides indications reminding that such requirements may have to be met in a national or local profile to complete cultural and linguistic requirements in some countries and hence should be considered in evaluation, as guidance to producers.

The TR is considered as a tool for examining products and thus is intended to help consumers in evaluating the ability of a product to support a given language and culture. At the same time it is also intended to help developers evaluating in advance or enhancing their product's capabilities with regards to cultural and linguistic adaptability.

It is expected that with the use of such a method, typically no product will be assigned a null mark, and typically none will also be able to achieve perfection, so that cultural and linguistic adaptability will be progressively defined in this way by the market and that it will constitute a moving – and evolving – target by nature. It is indeed more a tool to assist in the improvement of products.

The TR is presented in such a way that one individual or organization should be able to make its own benchmark in a sequential way by following the guidelines given, and establish the weightings attributed to each point evaluated in accordance with all parties involved in such an evaluation. As stated before, the goal is not to discard products but to help correct their weaknesses.

The TR is based on actual experience gathered initially at OQLF (*Office québécois de la langue française*) over four years in evaluating software (mainly) and hardware (mainly in the field of user interfaces, such as keyboards from different manufacturers, using profiles of standards and other specifications), with regards to meeting the different requirements of the French language and the cultural aspects relevant in Québec. This model project, nicknamed BETEL (*Banc d'essai technolinguistique*), experienced through a specific natural language and a specific cultural environment is being generalized here to cater for needs of any language in a similar way. The steps given in the TR constitute guidelines and criteria that could be enhanced over years. Hence this TR, which currently has modest but pragmatic goals in its evaluation, could also be updated in the future in line with comments received over months and years from the communities of its users.

Information technology — Guidelines, methodology and reference criteria for cultural and linguistic adaptability in information technology products

1 Scope

This Technical Report (TR) defines a methodology and a guided check-list for evaluation of cultural adaptability in software, hardware and other information technology (IT) products. The check-list and guidelines are not only applicable to all IT products, but also can be expanded to meet the requirements of specific cultural environments.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

cultural and linguistic adaptability

CLA

ability for a product, while keeping its portability and interoperability properties, to

- be internationalized, that is be adapted to the special characteristics of natural languages and the commonly accepted rules for their use, or of cultures in a given geographic region;
- take into account the usual needs of any category of users, with the exclusion of needs related to physical constraints

3.2

culture

set of uses, customs, and artistic, religious and intellectual expressions which are characteristic features of a group or a human society

4 Benchmark (Guidelines and criteria for evaluating CLA)

The following constitutes a sequential path to follow in order to establish a CLA evaluation benchmark. This is to be seen as a general *aide-mémoire* from which one can deviate by suppressing non-applicable elements or by adding relevant ones. In particular, software and hardware can use some common elements but in general

CLA characteristics of hardware (such as keyboards) are simpler to evaluate, if only the number of CLA elements to be considered is taken into consideration.

Once all the elements to be taken into consideration have been established, and before testing, relative weighting of each element occurs, against which evaluation will be determined before attributing a general score to a product, which may also permit product ranking.

4.1 Product identification and environment data for the evaluation report

In the evaluation report, the product is identified by a series of data items, given in 4.1.1 to 4.1.8.

4.1.1 Producer name, address and other coordinates

If copies of a software product to be evaluated can be downloaded through the Internet, the URL of the site where this can be done is documented here.

4.1.2 Product name, language(s) and version

The identification of the exact version evaluated is documented here (including the specific indication of the language[s] version if the core product was not produced in a linguistically neutral way), as accurately as possible. The evaluation can indeed be very different after an evaluation is fed back to the producer, which is likely to correct some, if not all, weaknesses identified in previous versions.

4.1.3 Product category

A summary of the general scope of the product evaluated and its main functions is given here.

4.1.4 Evaluation date

The evaluation date complements the version number. Some products are provided with fixed in between versions that may affect the validity of the results if this element is not well identified. It is highly recommended that all fixes available from the producer at the date of evaluation be applied to guarantee the accuracy of the report in a standardized way.

4.1.5 Evaluation team

This is essential historical data which could give an idea of the expertise of the evaluation team and of its credibility over a period of time. A minimum of four independent observers should provide their evaluations. The two extreme evaluations for each evaluated item should be discarded and the average evaluation of the remaining evaluations should be kept.

4.1.6 Test environment

This data documents the environment under which the tests were made, such as the actual keyboard used, the specific fonts used if relevant, the operating system and its version, the character set(s) used and so on.

4.1.7 Method used for acquiring the product

Here it may be relevant to say who sponsored the acquisition of the product, to make transparent the links that the evaluators may have with the producer. If the product was provided free of charge, it is important that no advantage was given to the evaluators.

4.1.8 Remarks on evaluation conditions

This gives some more data on issues or remarks that the evaluators could make on the conditions of the evaluation tests.

4.2 General cultural and linguistic profile of the product

This profile constitutes the first approach that a user may have in front of a new product. This approach also has relevant CLA requirements that are evaluated here under three different themes.

4.2.1 Packaging and product presentation in general

One can get a product fully packaged or in the case of software, optionally through downloading via a web site. In both cases the presentation may or may not respect the user language and culture. This element evaluates this first contact with a product. It is recommended that the evaluation report shows an image of either the physical packaging or of a screen capture from a web site, to illustrate the evaluation.

4.2.2 Install

Even if the final installed product may fully take into account the user language and culture, it is possible that the install process does not or does more or less. This element is intended to evaluate this characteristic. Again, in the report, pictures should document the evaluation as far as possible. Not only should the documentation respect the user language but so should the elements of the installation process, including for example installation file names or directory names whenever it is intended that they be significant for the installer (for example, a file called "README" or "ThisFileShouldBeDeleted" in English might be uninformative to a human installer whose language is not English). When file names can be determined by the user they should ideally allow the user to enter all national characters necessary to write a text.

Conflicts between the product installed and its environment should be identified (for example, installing a French piece of software on an English operating system or the reverse might have an adverse effect. When the install process gives such indications, they should be noted. Otherwise, the presence of inconsistencies in the user interface (for example, error messages not corresponding to the user language) should be assessed.

4.2.3 General elements to be evaluated

To quickly see if a product provides a general respect of the user language and culture the following elements should be examined: online help, dialog boxes, help captions, error messages, file names, and elements of after-sale service.

4.3 Local language and culture support

After the first approach to a product, this is the most important aspect of evaluation, as it undergoes detailed evaluation. Whenever international standards or national standards exist they should be considered for evaluation. In their absence, in certain areas additional private specifications may be of help.

Otherwise natural language support per se should be considered, which in general concerns input, process and output supporting the cultural and linguistic characteristics of the user.

4.3.1 Input method

The product evaluated should allow without interference the user language in all its richness. Normally one evaluates here the ability of the product to cope with international and national keyboard layout (for example ISO/IEC 9995), international or national entry method (for example ISO/IEC 14755) and to properly feed back the characters entered. Points should be given for each standard involved, as in general several may be involved.

4.3.2 Input (read)

The product evaluated should be able to read and correctly display a file that already contains the characters used in the user language. Either the identification of the language is explicit (tagging system identifying the character set, or in its absence it should be possible to identify it manually) or it is implicit (the product assumes that a given character set is used). Unless the coded character set used is the universal character
