Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 4156-1 was prepared by Technical Committee ISO/TC 14, *Shafts for machinery and accessories*.

This first edition of ISO 4156-1, together with ISO 4156-2 and ISO 4156-3, cancels and replaces ISO 4156:1981 and ISO 4156:1981/Amd 1:1992, of which it constitutes a technical revision. The values and tables are the same as in ISO 4156:1981; however, some explanations and definitions have been clarified.

ISO 4156 consists of the following parts, under the general title *Straight cylindrical involute splines — Metric module, side fit*:

- *Part 1: Generalities*
- *Part 2: Dimensions*
- *Part 3: Inspection*

<https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-e79b17716af6/iso-4156-1-2005>

Introduction

ISO 4156 provides the data and indications necessary for the design, manufacture and inspection of straight (non-helical) side-fitting cylindrical involute splines.

Straight cylindrical involute splines manufactured in accordance with ISO 4156 are used for clearance, sliding and interference connections of shafts and hubs. They contain all the necessary characteristics for the assembly, transmission of torque, and economic production.

The nominal pressure angles are 30° , $37,5^\circ$ and 45° . For electronic data processing purposes, the form of expression $37,5^\circ$ has been adopted instead of $37^\circ30'$. ISO 4156 establishes a specification based on the following modules:

— for pressure angles of 30° and $37,5^\circ$ the module increments are

0,5; 0,75; 1; 1,25; 1,5; 1,75; 2; 2,5; 3; 4; 5; 6; 8; 10

— for pressure angle of 45° the module increments are

0,25; 0,5; 0,75; 1; 1,25; 1,5; 1,75; 2; 2,5

Straight cylindrical involute splines — Metric module, side fit —

Part 1: Generalities

1 Scope

This part of ISO 4156 provides the data and indications necessary for the design and manufacture of straight (non-helical) side-fitting cylindrical involute splines.

Limiting dimensions, tolerances, manufacturing errors and their effects on the fit between connecting coaxial spline elements are defined in the equations and given in the tables. Unless otherwise specified, linear dimensions are expressed in millimetres and angular dimensions in degrees.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 286-1, *ISO system of limits and fits — Part 1: Bases of tolerances, deviations and fits*
<https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-e79b17716af6/iso-4156-1-2005>

ISO 1101, *Geometrical Product Specifications (GPS) — Geometrical tolerancing — Tolerances of form, orientation, location and run-out*

ISO 4156-2, *Straight cylindrical involute splines — Metric module, side fit — Part 2: Dimensions*

ISO 4156-3:2005, *Straight cylindrical involute splines — Metric module, side fit — Part 3: Inspection*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

spline joint

connecting, coaxial elements that transmit torque through the simultaneous engagement of equally spaced teeth situated around the periphery of a cylindrical external member with similar spaced mating spaces situated around the inner surface of the related cylindrical internal member

3.2

involute spline

member of spline joint having teeth or spaces that have involute flank profiles

3.3

internal spline

spline formed on the inner surface of a cylinder

3.4

external spline

spline formed on the outer surface of a cylinder

3.5

fillet

concave surface of the tooth or space connecting the involute flank and the root circle.

NOTE This curved surface as generated varies and cannot be properly specified by a radius of any given value.

3.6

fillet root spline

spline having a tooth or space profile in which the opposing involute flanks are connected to the root circle (D_{ei} or D_{ie} diameter) by a single fillet.

3.7

flat root spline

spline having a tooth or space profile in which each of the opposing involute flanks are connected to the root circle (D_{ei} or D_{ie} diameter) by a fillet

3.8

module

m

ratio of the circular pitch, expressed in millimetres, to the number π (or the ratio of the pitch diameter expressed in millimetres, to the number of teeth)

ITEH STANDARD PREVIEW

(standards.iteh.ai)

3.9

pitch circle

reference circle from which all normal spline dimensions are derived, and the circle on which the specified pressure angle has its nominal value

[ISO 4156-1:2005](https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-e79b17716afb/iso-4156-1-2005)

<https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-e79b17716afb/iso-4156-1-2005>

3.10

pitch diameter

D

diameter of the pitch circle, in millimetres, equal to the number of teeth multiplied by the module

3.11

pitch point

intersection of the spline tooth profile with the pitch circle

3.12

circular pitch

p

length of arc of the pitch circle between two consecutive pitch points of left- (or right-) hand flanks, which has a value of the number π multiplied by the module

3.13

pressure angle

α

acute angle between a radial line passing through any point on a tooth flank and the tangent plane to the flank at that point

3.14

standard pressure angle

α_D

pressure angle at the specified pitch point

3.15**base circle**

circle from which Involute spline tooth profiles are generated

3.16**base diameter**

D_b

diameter of the base circle

3.17**base pitch**

p_b

arc length of the base circle between two consecutive corresponding flanks

3.18**major circle**

outermost (largest) circle of the external or internal spline

3.19**major diameter**

D_{ee}, D_{ei}

diameter of the major circle

3.20**minor circle**

innermost (smallest) circle of the external or internal spline

3.21**minor diameter, D_{ie}, D_{ii}**

diameter of the minor circle

3.22**form circle**

circle used to define the depth of involute profile control

NOTE In the case of an external spline it is located near and above the minor diameter, and on an internal spline near and below the major diameter

3.23**form diameter**

D_{Fe}, D_{Fi}

diameter of the form circle

3.24**depth of engagement**

radial distance from the minor circle of the internal spline to the major circle of the external spline, minus corner clearance and/or chamfer depth

3.25**basic (circular) space width or tooth thickness at the pitch diameter**

E or S

for 30°, 37,5° and 45° pressure angle splines, half the circular pitch.

3.26**actual space width**

practically measured circular space width, on the pitch circle, of any single space width within the limit values

E_{max} and E_{min}

3.27
effective space width

E_v
space width where an imaginary perfect external spline would fit without clearance or interference, given by the size of the tooth thickness of this external spline, considering engagement of the entire axial length of the splined assembly

NOTE The minimum effective space width ($E_{v \min}$, always equal to E) of the internal spline is always basic, as shown in Table 3.

3.28
actual tooth thickness

practically measured circular tooth thickness, on the pitch circle, of any single tooth within the limit values S_{\max} and S_{\min}

3.29
effective tooth thickness

S_v
tooth thickness where an imaginary perfect internal spline would fit without clearance or interference, given by the size of the space width of this internal spline, considering engagement of the entire axial length of the splined assembly

3.30
effective clearance

c_v
(looseness or interference) effective space width of the internal spline minus the effective tooth thickness of the external spline

NOTE For looseness, c_v is positive; for interference, c_v is negative.

3.31
theoretical clearance

c
(looseness or interference) actual space width of the internal spline minus the actual tooth thickness of the external spline

NOTE It does not define the effective fit between internal and external spline, because of the effect of deviations.

3.32
form clearance

c_F
radial clearance between the form diameter of the internal spline and the major diameter of the external spline, or between the minor diameter of the internal spline and the form diameter of the external spline

NOTE It allows eccentricity of their respective pitch circles.

3.33
total pitch deviation

F_p
absolute value of the difference between the greatest positive and negative deviations from the theoretical spacing

3.34
total profile deviation

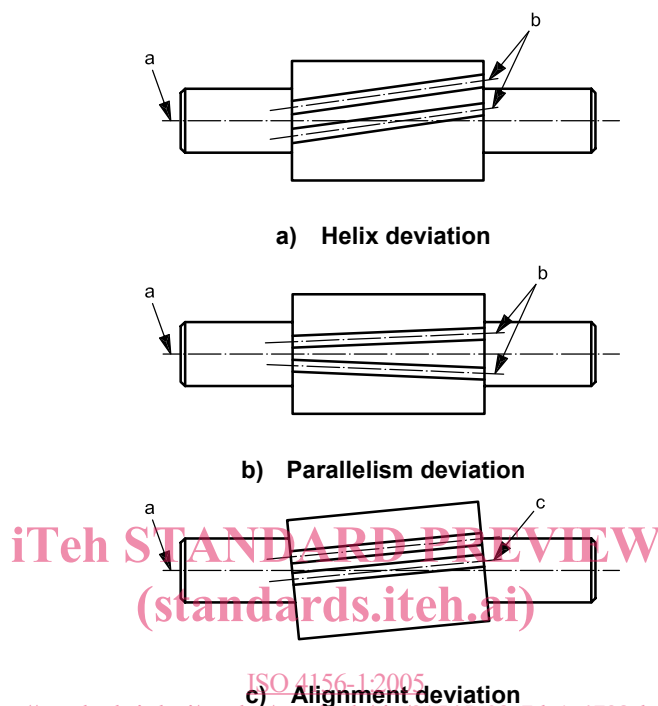

F_α
absolute value of the difference between the greatest positive and negative deviations from the theoretical tooth profile, measured normal to the flanks

3.35 total helix deviation

 F_{β}

absolute value of the difference between the two extreme deviations from the theoretical direction parallel to the reference axis

NOTE This includes parallelism and alignment deviations, see Figure 1.

- a Reference axis.
- b Centreline of teeth.
- c Effective spline axis.

Figure 1 — Helix deviations

3.36 parallelism deviation

deviation of parallelism of a single spline tooth to any other single spline tooth

See Figure 1 b).

3.37 alignment deviation

deviation of the effective spline axis with respect to the reference axis

See Figure 1 c).

3.38 out-of-roundness

deviation of the spline from a true circular configuration

3.39 effective deviation

accumulated effect of the spline deviations on the fit with the mating part

3.40
deviation allowance

λ
permissible deviation between minimum actual and minimum effective space width or maximum effective and maximum actual tooth thickness

3.41
machining tolerance

T
permissible deviation between maximum actual and minimum actual space width or tooth thickness

3.42
effective clearance tolerance

T_v
permissible deviation between maximum effective and minimum effective space width or tooth thickness

3.43
total tolerance

$T + \lambda$
machining tolerance plus the deviation allowance

3.43.1
total tolerance

⟨internal spline⟩ difference between the minimum effective space width and the maximum actual space width

3.43.2
total tolerance

⟨external spline⟩ difference between the maximum effective tooth thickness and the minimum actual tooth thickness

iTeh STANDARD PREVIEW
(standards.iteh.ai)

3.44
basic dimension

numerical value to describe the theoretically exact size, shape or location of a feature

<https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-e79b17716af6/iso-4156-1-2005>

NOTE It is the basis from which permissible deviations are established by tolerances.

3.45
auxiliary dimension

dimension, without tolerance, given for information purposes only, for the determination of the useful production and control dimensions.

4 Symbols, subscripts and abbreviated terms

4.1 General symbols

The general symbols used to designate the various spline terms and dimensions are given below.

D	Pitch diameter	mm
D_{Fe}	Form diameter, external spline	mm
$D_{Fe\ max}$	Maximum form diameter, external spline	mm
D_{Fi}	Form diameter, internal spline	mm
$D_{Fi\ min}$	Minimum form diameter, internal spline	mm
D_{Re}	Diameter of measuring ball or pin for external spline	mm
D_{Ri}	Diameter of measuring ball or pin for internal spline	mm
D_b	Base diameter	mm
D_{ee}	Major diameter, external spline	mm
$D_{ee\ max}$	Maximum major diameter, external spline	mm
$D_{ee\ min}$	Minimum major diameter, external spline	mm
D_{ei}	Major diameter, internal spline	mm
$D_{ei\ max}$	Maximum major diameter, internal spline	mm
$D_{ei\ min}$	Minimum major diameter, internal spline	mm
D_{ie}	Minor diameter, external spline	mm
$D_{ie\ max}$	Maximum minor diameter, external spline	mm
$D_{ie\ min}$	Minimum minor diameter, external spline	mm
D_{ii}	Minor diameter, internal spline	mm
$D_{ii\ max}$	Maximum minor diameter, internal spline	mm
$D_{ii\ min}$	Minimum minor diameter, internal spline	mm
E	Basic space width, circular	mm
E_{max}	Maximum actual space width	mm
E_{min}	Minimum actual space width	mm
E_v	Effective space width, circular	mm
$E_{v\ max}$	Maximum effective space width	mm
$E_{v\ min}$	Minimum effective space width	mm
F_p	Total cumulative pitch deviation	μm
F_α	Total profile deviation	μm
F_β	Total helix deviation	μm
K_e	Approximation factor for external spline	—
K_i	Approximation factor for internal spline	—
M_{Re}	Measurement over two balls or pins, external splines	mm
M_{Ri}	Measurement between two balls or pins, internal	mm
S	Basic tooth thickness, circular	mm

S_{\max}	Maximum actual tooth thickness	mm
S_{\min}	Minimum actual tooth thickness	mm
S_v	Effective tooth thickness, circular	mm
$S_{v \max}$	Maximum effective tooth thickness	mm
$S_{v \min}$	Minimum effective tooth thickness	mm
T	Machining tolerance	μm
T_v	Effective clearance tolerance	μm
W	Measurement over k teeth, external spline	mm
b	Spline length	mm
c_F	Form clearance	mm
c_v	Effective clearance (looseness or interference)	μm
$c_{v \max}$	Maximum effective clearance	μm
$c_{v \min}$	Minimum effective clearance	μm
d_{ce}	Ball or pin contact diameter, external spline	mm
d_{ci}	Ball or pin contact diameter, internal spline	mm
es_v	Fundamental deviation, external	μm
h_s	Form tooth height	mm
$\text{inv } \alpha$	Involute α ($= \tan \alpha - \pi \cdot \alpha / 180^\circ$)	—
k	Number of measured teeth	—
m	Module	mm
p	Circular pitch	mm
p_b	Base pitch	mm
z	Number of teeth	—
α	Pressure angle	$^\circ$
α_{Fe}	Pressure angle at form diameter, external spline	$^\circ$
α_{Fi}	Pressure angle at form diameter, internal spline	$^\circ$
α_{ce}	Pressure angle at ball or pin diameter, external spline	$^\circ$
α_{ci}	Pressure angle at ball or pin diameter, internal spline	$^\circ$
α_D	Standard pressure angle at pitch diameter	$^\circ$
α_e	Pressure angle at ball or pin centre, external spline	$^\circ$
α_i	Pressure angle at ball or pin centre, internal spline	$^\circ$
λ	Deviation allowance	μm
ρ_{Fa}	Fillet radius of the basic rack, external spline	mm
ρ_{Fi}	Fillet radius of the basic rack, internal spline	mm
$k; js; h; f; e; d$	Fundamental deviation of the external spline	μm

Iteh STANDARD PREVIEW
(standards.iteh.ai)

<https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-e79b17716afb/iso-4156-1-2005>

4.2 Subscripts

The following subscripts are used as part of the above general symbols to designate relative conditions or locations:

- i minor or internal (in the last case in the last position)
- e major or external (in the last case in the last position)
- b at the base
- c at contact point
- d tolerance based on pitch diameter (D)
- E tolerance based on space width (E) or tooth thickness (S)
- F pertaining to form diameter
- v effective
- R pertaining to gauges
- D standard

NOTE In electronic data processing (EDP), it is not always possible to present symbols in their theoretically correct form because of limitations of connected printing equipment. For this reason, some alternative symbols for EDP usage are given in Table 1 (for example, the symbol for D_b for base diameter may be printed as DB).

4.3 Formulae for dimensions and tolerances for all fit classes

<https://standards.iteh.ai/catalog/standards/sist/91545c02-7de1-4792-ba81-70b1776a8114-iso-4156-1-2005>

The formulae for dimensions and tolerances for all fit classes are given in Table 1.
