# TECHNICAL SPECIFICATION SPÉCIFICATION TECHNIQUE TECHNISCHE SPEZIFIKATION

## **CEN/TS 17021**

January 2017

ICS 13.040.40

**English Version** 

## Stationary source emissions - Determination of the mass concentration of sulphur dioxide by instrumental techniques

Émissions de sources fixes - Détermination de la concentration massique en dioxyde de soufre par des techniques instrumentales Emissionen aus stationären Quellen - Ermittlung der Massenkonzentration von Schwefeldioxid mit instrumentellen Verfahren

This Technical Specification (CEN/TS) was approved by CEN on 23 October 2016 for provisional application.

The period of validity of this CEN/TS is limited initially to three years. After two years the members of CEN will be requested to submit their comments, particularly on the question whether the CEN/TS can be converted into a European Standard.

CEN members are required to announce the existence of this CEN/TS in the same way as for an EN and to make the CEN/TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force (in parallel to the CEN/TS) until the final decision about the possible conversion of the CEN/TS into an EN is reached.

(Standards.iteh.ai) CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom://standards.iteh.a/catalog/standards/sist/4e2111b9-3cc4-46ce-b9de-

## **European foreword**

This document (CEN/TS 17021:2017) has been prepared by Technical Committee CEN/TC 264 "Air quality", the secretariat of which is held by DIN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

According to the CEN-CENELEC Internal Regulations, the national standards organisations of the following countries are bound to announce this Technical Specification: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

## iTeh STANDARD PREVIEW (standards.iteh.ai)

SIST-TS CEN/TS 17021:2017 https://standards.iteh.ai/catalog/standards/sist/4e2111b9-3cc4-46ce-b9deb40f9ab9dba8/sist-ts-cen-ts-17021-2017

### 1 Scope

This Technical Specification describes a method for sampling and determining the concentration of gaseous sulphur dioxide  $(SO_2)$  emissions from stacks. This method is based on instrumental techniques. It is applicable to both periodic measurements and the calibration of automated measuring systems permanently installed on stacks, for regulatory or other purposes.

### 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 15259:2007, Air quality - Measurement of stationary source emissions - Requirements for measurement sections and sites and for the measurement objective, plan and report

EN 14793:2016, Stationary source emission - Demonstration of equivalence of an alternative method with a reference method

EN 15267-4, Air quality - Certification of automated measuring systems - Part 4: Performance criteria and test procedures for automated measuring systems for periodic measurements of emissions from stationary sources

EN ISO 14956:2002, Air quality Evaluation of the suitability of a measurement procedure by comparison with a required measurement uncertainty (ISO 14956:2002) (standards.iteh.ai)

ISO/IEC Guide 98-3, Uncertainty of measurement — Part 3: Guide to the expression of uncertainty in measurement (GUM:1995) <u>SIST-TS CEN/TS 17021:2017</u>

#### **3 Terms and definitions**>40f9ab9dba8/sist-ts-cen-ts-17021-2017

For the purposes of this document, the following terms and definitions apply.

### 3.1 standard reference method SRM

reference method prescribed by European or national legislation

[SOURCE: EN 15259:2007]

#### 3.2 reference method RM

measurement method taken as a reference by convention, which gives the accepted reference value of the measurand

NOTE 1 A reference method is fully described.

NOTE 2 A reference method can be a manual or an automated method.

NOTE 3 Alternative methods can be used if equivalence to the reference method has been demonstrated.

[SOURCE: EN 15259:2007]

### 3.3

## alternative method

#### AM

measurement method which complies with the criteria given by this Technical Specification with respect to the reference method

Note 1 to entry: An alternative method can consist of a simplification of the reference method.

[SOURCE: EN 14793:2017]

#### 3.4

#### measuring system

set of one or more measuring instruments and often other devices, including any reagent and supply, assembled and adapted to give information used to generate measured quantity values within specified intervals for quantities of specified kinds

[SOURCE: JCGM 200:2012]

#### 3.5

## automated measuring system

## AMS

entirety of all measuring instruments and additional devices for obtaining a result of measurement

Note 1 to entry: Apart from the actual measuring device [the analyser], an/AMS includes facilities for taking samples (e.g. probe, sample gas lines, flow meters and regulator, delivery pump) and for sample conditioning (e.g. dust filter, pre-separator for interferents, cooler, converter). This definition also includes testing and adjusting devices that are required for functional checks and, if applicable, for commissioning.

Note 2 to entry: The term "automated measuring system" (AMS) is typically used in Europe. The term "continuous emission monitoring system" (CEMS) is also typically used in the UK and USA.

[SOURCE: EN 15267-4:2017]

#### 3.6

## portable automated measuring system

#### P-AMS

automated measuring system which is in a condition or application to be moved from one to another measurement site to obtain measurement results for a short measurement period

Note 1 to entry: The measurement period is typically 8 h for a day.

Note 2 to entry: The P-AMS can be configured at the measurement site for the special application but can be also set-up in a van or mobile container. The probe and the sample gas lines are installed often just before the measurement task is started.

[SOURCE: EN 15267-4:2017]

### 3.7

#### calibration

set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring method or measuring system, and the corresponding values given by the applicable reference

Note 1 to entry: In case of automated measuring system (AMS) permanently installed on a stack the applicable reference is the standard reference method (SRM) used to establish the calibration function of the AMS.

Note 2 to entry: Calibration should not be confused with adjustment of a measuring system.

[SOURCE: EN 15058:2017]

#### 3.8

3.9

#### adjustment

set of operations carried out on a measuring system so that it provides prescribed indications corresponding to given values of a quantity to be measured

The adjustment can be made directly on the instrument or using a suitable calculation Note 1 to entry: procedure.

[SOURCE: EN 15058:2017]

#### iTeh STANDARD PREVIEW span gas

test gas used to adjust and check a specific point on the response line of the measuring system

Note 1 to entry: This concentration is often chosen around 80 % of the upper limit of the range

https://standards.iteh.ai/catalog/standards/sist/4e2111b9-3cc4-46ce-b9de-3.10 b40f9ab9dba8/sist-ts-cen-ts-17021-2017 measurand

particular quantity subject to measurement

#### [SOURCE: EN 15259:2007]

The measurand is a quantifiable property of the stack gas under test, for example mass Note 1 to entry: concentration of a measured component, temperature, velocity, mass flow, oxygen content and water vapour content.

#### 3.11

#### interference

negative or positive effect upon the response of the measuring system, due to a component of the sample that is not the measurand

#### 3.12

#### influence quantity

quantity that is not the measurand but that affects the result of the measurement

Influence quantities are e.g. presence of interfering gases, ambient temperature, pressure of the Note 1 to entry: gas sample.

#### 3.13

#### ambient temperature

temperature of the air around the measuring system

#### 3.14 emission limit value

#### ELV

limit value given in regulations such as EU Directives, ordinances, administrative regulations, permits, licences, authorizations or consents

Note 1 to entry: ELV can be stated as concentration limits expressed as half-hourly, hourly and daily averaged values, or mass flow limits expressed as hourly, daily, weekly, monthly or annually aggregated values.

#### 3.15

#### measurement site

place on the waste gas duct in the area of the measurement plane(s) consisting of structures and technical equipment, for example working platforms, measurement ports, energy supply

Note 1 to entry: Measurement site is also known as sampling site.

[SOURCE: EN 15259:2007]

#### 3.16

#### measurement plane

plane normal to the centreline of the duct at the sampling position

Note 1 to entry: Measurement plane is also known as sampling plane.

[SOURCE: EN 15259:2007]

## (standards.iteh.ai)

iTeh STANDARD PREVIEW

#### 3.17

measurement port

opening in the waste gas duct along the measurement line, the unit waste gas is gained b40f9ab9dba8/sist-ts-cen-ts-17021-2017

Note 1 to entry: Measurement port is also known as sampling port or access port.

#### [SOURCE: EN 15259:2007]

#### 3.18

#### measurement line

line in the measurement plane along which the measurement points are located, bounded by the inner duct wall

Note 1 to entry: Measurement line is also known as sampling line.

[SOURCE: EN 15259:2007]

#### 3.19

#### measurement point

position in the measurement plane at which the sample stream is extracted or the measurement data are obtained directly

Note 1 to entry: Measurement point is also known as sampling point.

[SOURCE: EN 15259:2007]

#### 3.20

#### performance characteristic

one of the quantities (described by values, tolerances, range) assigned to equipment in order to define its performance

#### 3.21

#### response time

duration between the instant when an input quantity value of a measuring instrument or measuring system is subjected to an abrupt change between two specified constant quantity values and the instant when a corresponding indication settles within specified limits around its final steady value

Note 1 to entry: By convention time taken for the output signal to pass from 0 % to 90 % of the final variation of indication.

#### 3.22

#### short-term zero drift

difference between two zero readings at the beginning and at the end of the measurement period

#### 3.23

#### short-term span drift

difference between two span readings at the beginning and at the end of the measurement period

#### 3.24

## lack of fit iTeh STANDARD PREVIEW

systematic deviation within the range of application between the measurement result obtained by applying the calibration function to the observed response of the measuring system measuring test gases and the corresponding accepted value of such test gases

SIST-TS CEN/TS 17021:2017

Note 1 to entry: Lack of fit can be a function of the measurement result4-46ce-b9de-

#### b40f9ab9dba8/sist-ts-cen-ts-17021-2017

Note 2 to entry: The expression "lack of fit" is often replaced in everyday language by "linearity" or "deviation from linearity".

#### 3.25

#### repeatability in the laboratory

closeness of the agreement between the results of successive measurements of the same measurand carried out under the same conditions of measurement

Note 1 to entry: Repeatability conditions include:

- same measurement method;
- same laboratory;
- same measuring system, used under the same conditions;
- same location;
- repetition over a short period of time.

Note 2 to entry: Repeatability can be expressed quantitatively in terms of the dispersion characteristics of the results.

Note 3 to entry: In this Technical Specification the repeatability is expressed as a value with a level of confidence of 95 %.

#### 3.26

#### repeatability in the field

closeness of the agreement between the results of simultaneous measurements of the same measurand carried out with two sets of equipment under the same conditions of measurement

Note 1 to entry: These conditions include:

- same measurement method;
- two sets of equipment, the performances of which are fulfilling the requirements of the measurement method, used under the same conditions;
- same location;
- implemented by the same laboratory;
- typically calculated on short periods of time in order to avoid the effect of changes of influence parameters (e.g. 30 min).

Note 2 to entry: Repeatability can be expressed quantitatively in terms of the dispersion characteristics of the results.

Note 3 to entry: In this Technical Specification, the repeatability under field conditions is expressed as a value with a level of confidence of 95 %.

#### 3.27

## iTeh STANDARD PREVIEW

#### reproducibility in the field

## (standards.iteh.ai)

closeness of the agreement between the results of simultaneous measurements of the same measurand carried out with several sets of equipment under the same conditions of measurement

Note 1 to entry: These conditions are called field reproducibility conditions and include:

- same measurement method;
- several sets of equipment, the performances of which are fulfilling the requirements of the measurement method, used under the same conditions;
- same location;
- implemented by several laboratories.

Note 2 to entry: Reproducibility can be expressed quantitatively in terms of the dispersion characteristics of the results.

Note 3 to entry: In this Technical Specification, the reproducibility under field conditions is expressed as a value with a level of confidence of 95 %.

#### 3.28

#### residence time in the measuring system

time period for the sampled gas to be transported from the inlet of the probe to the inlet of the measurement cell

#### 3.29

#### uncertainty

parameter associated with the result of a measurement that characterizes the dispersion of the values that could reasonably be attributed to the measurand

#### 3.30 standard uncertainty u

uncertainty of the result of a measurement expressed as a standard deviation

### 3.31

#### combined uncertainty

Uc

standard uncertainty attached to the measurement result calculated by combination of several standard uncertainties according to the principles laid down in ISO/IEC Guide 98-3 (GUM)

#### 3.32 expanded uncertainty U

quantity defining an interval about the result of a measurement that may be expected to encompass a large fraction of the distribution of values that could reasonably be attributed to the measurand

 $U = k \times u_c$ 

Note 1 to entry: In this European Technical Specification, the expanded uncertainty is calculated with a level of confidence of 95 %.

Note 2 to entry: The expression overall uncertainty is sometimes used to express the expanded uncertainty.

## iTeh STANDARD PREVIEW

## 3.33

(standards.iteh.ai)

uncertainty budget calculation table combining all the sources of uncertainty according to EN ISO 14956 or ISO/IEC Guide 98-3 in order to calculate the combined uncertainty of the method at a specified value

## 4.1 Symbols

For the purposes of this document, the following symbols apply.

$A(t_0)$	(result given by the analyser after adjustment at $t_0$ at span point – result given by the
	analyser after adjustment at $t_0$ at zero point) / (calibration gas concentration at span point
	<ul> <li>calibration gas concentration at zero point)</li> </ul>

- $B(t_0)$ result given by the analyser after adjustment at  $t_0$  at zero point
- С measured concentration

 $C_{\rm corr}$ measured concentration corrected for drift

- Drift(A) {[(result given by the analyser during the drift check at  $t_{end}$  at span point – result given by the analyser during the drift check at  $t_{end}$  at zero point) / (calibration gas concentration at span point – calibration gas concentration at zero point)] –  $A(t_0)$ } /  $(t_{end} - t_0)$
- Drift(*B*) (result given by the analyser during the drift check at  $t_{end}$  at zero point – result given by the analyser after adjustment at  $t_0$  at zero point) /  $(t_{end} - t_0)$
- volume fraction f
