July 1975

BRIEF HISTORY

Addendum 1 to ISO Recommendation R 91-1970 was drawn up by Technical Committee ISO/TC 28, *Petroleum products*, and circulated to the Member Bodies in February 1974.

It has been approved by the Member Bodies of the following countries :

Australia	Hungary	Romania
Austria	India	South Africa, Rep. of
Belgium	Israel	Spain
Czechoslovakia	Japan	Thailand
Egypt, Arab Rep. of	Mexico	Turkey
France	Netherlands	United Kingdom
Germany	Poland	U.S.S.R.

<https://standards.iteh.ai/catalog/standards/sist/71d244f1-d380-4246-8730>

The Member Bodies of the following countries expressed disapproval of the document on technical grounds :

Canada
U.S.A.

Addendum 1 – May 1975 – to ISO Recommendation R 91-1970

PETROLEUM MEASUREMENT TABLES

TABLES BASED ON A REFERENCE TEMPERATURE OF 20 °C

1 SCOPE

This Addendum to ISO Recommendation R 91-1970 comprises petroleum measurement tables based on a reference temperature of 20 °C. These tables, known generally as "20 °C Tables", are for use in the calculation of quantities of crude petroleum and petroleum products at a standard temperature of 20 °C. Tables are provided over normal operating ranges for the reduction of density and volume to the standard state, and for the calculation of mass-volume relationships. Results obtained by the use of these tables give comparable figures to those derived for the standard temperatures of 60 °F and 15 °C by the use of factors from the tables referred to in ISO/R 91-1970.

iTeh STANDARD PREVIEW

2 FIELD OF APPLICATION

(standards.iteh.ai)

- 2.1 These tables are intended for application to crude petroleum regardless of source and to all normally liquid petroleum products derived therefrom regardless of the method of manufacture. In the preparation of these tables for density values above 0,600, it has been assumed for the purpose of standardization that all crude petroleum and petroleum products having similar densities have uniform coefficients of expansion.
In the case of certain crudes and the liquid products derived from them, minor discrepancies may arise in the calculation of oil quantities.
- 2.2 The tables cover a density range of 0,500 to 1,100.
- 2.3 The tables which involve reduction of density to standard temperature assume that the measurement has been made by means of a glass hydrometer calibrated in kg/l (g/ml) at 20 °C and accordingly a correction for the thermal expansion of hydrometer glass has been incorporated which is in accord with the recommended value given in ISO/R 1768, *Glass hydrometers – Conventional value for the thermal expansion coefficient (for use in the preparation of measurement tables for liquids)*.

3 GENERAL

3.1 Definition of terms

Constants and factors used in the computation of the tables contained in this addendum are identical, wherever possible, with those employed in the tables referred to in ISO/R 91-1970. A review of significant terms is given here.

The implied definition of "density" as used in these tables is mass per unit volume at 20 °C, expressed in kilograms per litre (kg/l).

Relative density¹⁾ 60/60 °F is the ratio of the mass of a volume of a petroleum product at 60 °F to the mass of the same volume of water at 60 °F.

API gravity is based on the formula

$$^{\circ}\text{API} = \frac{141,5}{\text{Relative density } 60/60 \text{ } ^{\circ}\text{F}} - 131,5$$

3.2 Comparison of mass determined by calculation from volume and density and the quantity measured by direct weighing in air

When the quantity of oil is calculated by the multiplication of the determined density by the volume in litres at the same temperature, the result is a mass. In order to compare such a result with the corresponding values obtained by weighing in air in the U.S.A. system or the British system of measuring, it must be corrected for the effect of the buoyancy of air on the liquid being weighed and on the brass weights²⁾. This correction has been incorporated into the values in these tables.

3.3 Significant figures in reporting bulk quantities of oil

The number of significant figures to be used in the reporting of bulk oil quantities should not be greater than the minimum necessary to express adequately a particular quantity with due regard to the accuracy in measurement and the accuracy desired for use. No rigid rules for significant figures can be laid down which will cover every eventuality; however, the following is given as guidance :

All values should be rounded off to five significant figures except :

- a) where a larger number of digits is necessary to satisfy fiscal, customs or other authorities' requirements;
- b) where a quantity exceeds a five-digit number, in which case the figure should be rounded off to the nearest digit;
- c) where units of the order of size of kilograms, litres, pounds or gallons are used, in which case the values should be reported to the nearest whole kilogram, litre, pound or gallon;
- d) where units of the order of size of barrels, tonnes or long tons are used, in which case the values should be reported to not more than two decimal places.

Examples :

528 kg; 410,72 tonnes; 122 lb; 1 060,8 long tons; 116 litres, 75 012 gal (UK); 4 023 486 gal (US); 116 223 barrels (US).

NOTE – This recommendation applies to the final reported quantity only. Intermediate values in the course of calculation should retain sufficient figures to ensure the greatest possible arithmetical accuracy.

4 TABLES

In the following tables, the constants and factors used in the computation were identical, wherever possible, with those employed in the computation of the tables referred to in ISO/R 91-1970.

1) This term is now used in lieu of "specific gravity".

2) It is assumed that the weights are made of brass of density 0,814 3 g/ml at 0 °C.

TABLE A

Reduction of observed density (kg/l)
to density (kg/l) at 20 °C

This table gives values of density in kilograms per litre at 20 °C corresponding to densities observed with a glass hydrometer at temperatures other than 20 °C.

The expression "observed hydrometer reading" appears in the table heading, since this hydrometer reading differs slightly from the true density at the observed temperature owing to the expansion or contraction of the glass hydrometer when its temperature differs from its calibration temperature of 20 °C. Accordingly, a correction for hydrometer glass expansion was included along with the expansion of petroleum products in the preparation of this table. For this reason, the table is not to be used for densities observed by any other means.

This table must be entered only with densities measured with a soda-lime glass hydrometer calibrated at 20 °C.

NOTE — Where a pressure hydrometer has been used to obtain a density for L.P.G. below 0,650 density it should be noted that the coefficient of expansion may be different from that of soda-lime glass. However, since the factors in this range are given only to three significant figures any difference will be negligible and may be neglected.

(Attention is drawn in the following example to the change from three to four significant figures in the factors.)

Example :

iTeh STANDARD PREVIEW
[standards.iteh.ai](https://standards.iteh.ai/catalog/standards/sist/71d244f1-d380-4246-8730-0647)

If the density (kg/l) of an oil is 0,6448 at 27,5 °C, what is its density (kg/l) at 20 °C?

Enter the table with the column headed 0,640 under "observed hydrometer reading" and note that against "Obs. temp. °C" 27,5 the "corresponding density 20 °C" is [https://standards.iteh.ai/catalog/standards/sist/71d244f1-d380-4246-8730-0647 kg/l](https://standards.iteh.ai/catalog/standards/sist/71d244f1-d380-4246-8730-0647)

Likewise, note that for a density of 0,650 at 27,5 °C the corresponding value at 20 °C is 0,6569 which rounded off to three significant figures is 0,657 kg/l

Thus, for an increase of 0,010 in the observed value at 27,5 °C there is an increase of 0,010 at 20 °C. Therefore, by simple proportion, for a change in density at 27,5 °C from 0,640 to 0,6448 there is a change in the density at 20 °C by [(0,010/0,010) X (+ 0,0048)] or + 0,005 kg/l

Then, the density at 20 °C corresponding to the density of 0,6448 at 27,5 °C is [0,647 + 0,005] or 0,652 kg/l
