## iTeh STANDARD PREVIEW (standards.iteh.ai)

[ISO 10426-2:2003](#)

<https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-8fc620289df0/iso-10426-2-2003>

## Foreword

ISO (the International Organisation for Standardisation) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organisations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardisation.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 10426-2 was prepared by Technical Committee ISO/TC 67, *Materials, equipment and offshore structures for petroleum, petrochemical and natural gas industries*, Subcommittee SC 3, *Drilling and completion fluids and well cements*.

## iTeh STANDARD PREVIEW

ISO 10426 consists of the following parts, under the general title *Petroleum and natural gas industries — Cements and materials for well cementing*:

- *Part 1: Specification* [ISO 10426-2:2003](#)  
<https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-8fc620289df0/iso-10426-2-2003>
- *Part 2: Testing of well cements*
- *Part 3: Testing of deepwater well cement formulations*
- *Part 4: Preparation and testing of foamed cement slurries at atmospheric pressure*

The following part is under preparation:

- *Part 5: Determination of shrinkage and expansion of well cement formulations at atmospheric pressure*

## Introduction

This part of ISO 10426 is based on API RP 10B, 22nd edition, December 1997, addendum 1, October 1999.

Users of this part of ISO 10426 should be aware that further or differing requirements may be needed for individual applications. This part of ISO 10426 is not intended to inhibit a vendor from offering, or the purchaser from accepting, alternative equipment or engineering solutions for the individual application. This may be particularly applicable where there is innovative or developing technology. Where an alternative is offered, the vendor should identify any variations from this part of ISO 10426 and provide details.

In this part of ISO 10426, where practical, US Customary units are included in brackets for information.

Well cement classes and grades are defined in ISO 10426-1.

# Petroleum and natural gas industries — Cements and materials for well cementing —

## Part 2: Testing of well cements

### 1 Scope

This part of ISO 10426 specifies requirements and gives recommendations for the testing of cement slurries and related materials under simulated well conditions.

### 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 10414-1, *Petroleum and natural gas industries — Field testing of drilling fluids — Part 1: Water-based fluids* [ISO 10426-2:2003](#)

<https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-2632917310262199>

API RP 13J, *Testing of heavy brines (second edition)*, March 1996

ASTM C 109, *Standard test method for compressive strength of hydraulic cement mortars (using 2 in. or [50 mm] cube specimens)*

ASTM C 188, *Standard test method for density of hydraulic cement*

### 3 Terms, definitions and symbols

#### 3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

##### 3.1.1

##### **absolute volume**

reciprocal of absolute density

NOTE It is expressed as volume per unit mass.

##### 3.1.2

##### **additive**

material added to a cement slurry to modify or enhance some desired property

NOTE Common properties that are modified include: setting time (by use of retarders or accelerators), fluid loss control, viscosity, etc.

**3.1.3**

**annulus**

space surrounding the pipe in the wellbore

NOTE The outer wall of the annular space may be either surface or casing

**3.1.4**

**assumed surface temperature**

$T_{AS}$

assumed temperature at surface used for calculating a pseudo-temperature gradient

**3.1.5**

**batch mixing**

process of mixing and holding a volume of cement slurry prior to placement in the wellbore

**3.1.6**

**Bearden units of consistency**

units used to express consistency of a cement slurry when determined on a pressurized consistometer

NOTE The symbol for consistency when expressed in Bearden units is  $B_C$ .

**3.1.7**

**blowout**

point in time at which nitrogen flows through the sample in a fluid loss test

**3.1.8**

**iTeh STANDARD PREVIEW**  
**(standards.iteh.ai)**

**3.1.9**

**casing cementing**

[ISO 10426-2:2003](https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-81c620289d10/iso-10426-2-2003)

complete or partial annular cementing of a full casing string

**3.1.10**

**cement**

**Portland cement**

ground clinker generally consisting of hydraulic calcium silicates and aluminates and usually containing one or more of the forms of calcium sulfate as an interground addition

NOTE 1 Hydraulic calcium silicates and aluminates are those which harden under water.

NOTE 2 Interground additions are added before grinding, rather than after grinding.

**3.1.11**

**cement class**

**cement type**

designation achieved using the ISO system of classifications of well cement in accordance with its intended use

NOTE See ISO 10426-1 for further information.

**3.1.12**

**cement grade**

designation achieved using the ISO system for denoting the sulfate resistance of a particular cement

NOTE See ISO 10426-1 for further information.

**3.1.13****cement blend**

mixture of dry cement and other dry materials

**3.1.14****clinker**

fused materials from the kiln in cement manufacturing that are interground with calcium sulfate to make cement

**3.1.15****compatibility**

capacity to form a fluid mixture that does not undergo undesirable chemical and/or physical reactions

**3.1.16****compressive strength**

strength of a set cement sample measured by the force required to crush it

NOTE It is expressed as force per unit area.

**3.1.17****consistometer**

device used to measure the thickening time of a cement slurry under specified temperature and pressure

**3.1.18****continuous-pumping squeeze-cementing operation**

squeeze-cementing operation that does not involve cessation of pumping

## THE STANDARD REVIEW

### (standards.iteh.ai)

**3.1.19****equivalent sack**

mass of the blend of Portland cement and fly ash or pozzolan that has the same absolute volume as 42,63 kg (94 lbs) of Portland cement

<https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-8fc620289df0/iso-10426-2-2003>

**3.1.20****filtrate**

liquid that is forced out of a cement slurry during a fluid loss test

**3.1.21****fly ash**

powdered residue from the combustion of coal having pozzolanic properties

NOTE See Clause 17 for further description.

**3.1.22****free fluid**

coloured or colourless liquid which has separated from a cement slurry

**3.1.23****freeze-thaw cycle**

test involving a cement sample that is alternately exposed to temperatures above and below the freezing point of water

**3.1.24****hesitation-pumping squeeze-cementing operation**

squeeze-cementing operation that incorporates discontinuous pumping of the cement slurry

NOTE The slurry is placed into the well, the pumps are stopped for some period of time, then a volume of slurry is again pumped. The process is repeated until a predetermined pressure is reached or the volume of cement slurry has been completely pumped.

**3.1.25**

**heat-up rate**

$R_h$

rate of slurry temperature change on going from the surface temperature,  $T_{SS}$ , to the predicted bottom-hole circulating temperature,  $T_{PBHC}$

**3.1.26**

**liner cementing**

annular cementing operations for which the top of the casing being cemented is not at the top the wellbore

**3.1.27**

**mud**

fluid that is circulated through the wellbore during drilling or workover operations

**3.1.28**

**mud balance**

beam-type balance used to measure fluid density at atmospheric pressure

**3.1.29**

**neat cement slurry**

cement slurry consisting of only cement and water

**3.1.30**

**pressure-down rate**

$R_{pd}$

rate at which pressure is reduced from the bottom-hole pressure,  $p_{BH}$ , to the pressure at the top of cement column,  $p_{TOC}$ , during a thickening-time test  
**iTeh STANDARD PREVIEW (standards.iteh.ai)**

**3.1.31**

**permeability**

measure of the capacity of a porous medium to allow flow of fluids or gases  
<http://standards.iteh.ai/standard/iso-10426-2-2003-8fc620289df0/iso-10426-2-2003>

NOTE Permeability is usually expressed in millidarcy, mD.

**3.1.32**

**plug cementing**

process of placing a volume of cement in a well to form a plug across the wellbore

**3.1.33**

**pozzolan**

siliceous or siliceous and aluminous material which in finely divided form reacts with calcium hydroxide to form a cementitious material

NOTE See Clause 17 for further description.

**3.1.34**

**preflush, noun**

fluid containing no insoluble weighting agents used to separate drilling fluids and cementing slurries

**3.1.35**

**pressure vessel**

vessel in a consistometer into which the slurry container is placed for the thickening-time test

**3.1.36**

**pressurized curing vessel**

vessel used for curing a sample of cement under temperature and pressure for compressive strength testing

**3.1.37****pressure-up rate** $R_{pu}$ 

rate at which pressure is increased from the starting pressure to the bottom-hole pressure during a thickening-time test

**3.1.38****relative density****specific gravity**

ratio of the mass of a substance to the mass of an equal volume of a standard substance at a reference temperature

NOTE The standard substance is usually water; the reference temperature is usually 4 °C.

**3.1.39****sedimentation**

separation and settling of solids in a cement slurry

**3.1.40****slurry container**

container in a pressurized consistometer used to hold the slurry for conditioning purposes or for thickening-time test

**3.1.41****sonic strength**

extent of strength development of a cement sample calculated by measuring the velocity of sound through it

NOTE The calculation is based on specific mathematical correlations and not on direct measurements of strength.

**3.1.42****starting pressure**

[ISO 10426-2:2003](#)

<https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-8fc620289df0/iso-10426-2-2003>

initial pressure applied to the test sample at the beginning of the thickening-time test

NOTE  $p_S$  is also used to determine the pressure-up rate.

**3.1.43****spacer**

fluid containing insoluble weighting materials that is used to separate drilling fluids and cementing slurries

**3.1.44****squeeze-cementing**

remedial process in which cementing material is forced under pressure into a specific portion of the well such as a fracture or opening

**3.1.45****static fluid loss test**

test to determine fluid lost from a cement slurry when placed against a 325 mesh screen at 6 900 kPa (1 000 psi) differential pressure

**3.1.46****static stability test**

test to determine the degree of sedimentation and free fluid development in a cement slurry

**3.1.47****stirred fluid-loss cell**

cell specially designed to allow for conditioning of the cement slurry within the same cell used to perform a static fluid loss test

**3.1.48**

**strength retrogression**

reduction in compressive strength and increase in permeability of a cement caused by exposure to temperatures exceeding 110 °C (230 °F)

**3.1.49**

**thickening time**

time required for a cement slurry to develop a selected Bearden consistency value

NOTE The results of a thickening-time test provide an indication of the length of time a cement slurry can remain pumpable under the test conditions.

**3.1.50**

**weigh batch mixer**

**scale tank**

device or system for the weighing and blending of cement with dry additives

**3.1.51**

**well simulation test**

test whose parameters are designed and modified as required to simulate the conditions found in a wellbore

## iTeh STANDARD PREVIEW (standards.iteh.ai)

[ISO 10426-2:2003](#)

<https://standards.iteh.ai/catalog/standards/sist/8d15dc8a-a92b-447f-849d-8fc620289df0/iso-10426-2-2003>

### 3.2 Symbols

For the purposes of this part of ISO 10426, the symbols given in Table 1 apply. This list is non-exhaustive.

**Table 1 — Symbols**

Symbol	Meaning
$h_{TOCTVD}$	top-of-cement true vertical depth
$p_{BH}$	bottom-hole pressure <sup>b</sup>
$p_S$	starting pressure
$p_{TOC}$	top-of-cement pressure
$T_{AS}$	assumed surface temperature
$T_{BHC}$	bottom-hole circulating temperature <sup>a</sup>
$T_{BHS}$	bottom-hole static temperature
$T_{PBHC}$	predicted bottom-hole circulating temperature
$T_{MRBHS}$	maximum recorded bottom-hole temperature after a static period
$T_{MNRBHC}$	minimum recorded bottom-hole temperature after sufficient circulation in the well to obtain a stabilized or steady-state temperature
$T_{PS}$	predicted squeeze temperature
$\nabla_{PT}$	pseudo-temperature gradient <sup>c</sup>
$T_{PU}$	pseudo-undisturbed temperature
$T_{RS}$	recorded squeeze temperature <a href="https://standards.iteh.ai/catalog/standards/iso/iso-10426-2-2003-447f849d-8fc62023940/iso-10426-2-2003">https://standards.iteh.ai/catalog/standards/iso/iso-10426-2-2003-447f849d-8fc62023940/iso-10426-2-2003</a>
$T_{SS}$	slurry surface temperature
$T_{TOCC}$	top-of-cement circulating temperature
$T_{TOCS}$	top-of-cement static temperature
$T_{TOC}$	top-of-cement column temperature
$T_{UF}$	undisturbed formation temperature
$t_a$	time to displace the leading edge of the cement slurry from bottom of the casing to the top of the annular cement column
$t_d$	time to displace the leading edge of cement slurry to the bottom of the wellbore or other predetermined location in the well

a The  $T_{BHC}$  can vary with time, fluid being circulated, pump rate, pipe size, etc.  
 b Hydrostatic pressure at the bottom of the well, calculated from the true vertical depth and the fluid densities in the wellbore.  
 c Gradient in  $^{\circ}\text{C}/100 \text{ m}$  ( $^{\circ}\text{F}/100 \text{ ft}$ ), calculated from the difference between the maximum recorded bottom-hole static temperature ( $T_{MRBHS}$ ) and the  $T_{AS}$ .
