## Publication numbering

As from 1 January 1997 all IEC publications are issued with a designation in the 60000 series. For example, IEC 34-1 is now referred to as IEC 60034-1.

## Consolidated editions

The IEC is now publishing consolidated versions of its publications. For example, edition numbers 1.0, 1.1 and 1.2 refer, respectively, to the base publication, the base publication incorporating amendment 1 and the base publication incorporating amendments 1 and 2.

## Further information on IEC publications

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology. Information relating to this publication, including its validity, is available in the IEC Catalogue of publications (see below) in addition to new editions, amendments and corrigenda. Information on the subjects under consideration and work in progress undertaken by the technical committee which has prepared this publication, as well as the list of publications issued, is also available from the following:

- **IEC Web Site** ([www.iec.ch](http://www.iec.ch))
- **Catalogue of IEC publications**  
The on-line catalogue on the IEC web site ([www.iec.ch/searchpub](http://www.iec.ch/searchpub)) enables you to search by a variety of criteria including text searches, technical committees and date of publication. On-line information is also available on recently issued publications, withdrawn and replaced publications, as well as corrigenda.
- **IEC Just Published** ([standards.iteh.ai](http://standards.iteh.ai))  
This summary of recently issued publications ([www.iec.ch/online\\_news/justpub](http://www.iec.ch/online_news/justpub)) is also available by email. Please contact the Customer Service Centre (see below) for further information. <https://standards.iteh.ai/catalog/standards/sist/4483141f-ee33-4255-a8e4-a151d8fcb388/iec-62264-2-2004>
- **Customer Service Centre**

## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## ENTERPRISE-CONTROL SYSTEM INTEGRATION –

## Part 2: Object model attributes

## FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62264-2 has been prepared by subcommittee 65A: System aspects, of IEC technical committee 65: Industrial-process measurement and control, and ISO SC5, JWG 15, of ISO technical committee 184: Enterprise-control system integration.

It is published as double logo standard.

This standard is based upon ANSI/ISA-95.00.02-2001, Enterprise-Control System Integration, Part 2: Object Model Attributes. It is used with permission of the copyright holder, the Instrumentation, Systems and Automation Society (ISA)<sup>1</sup>. ISA encourages the use and application of its industry standards on a global basis.

<sup>1</sup> For information on ISA standards, contact ISA at: ISA – The Instrumentation, Systems and Automation Society, PO Box 12277, Research Triangle Park, NC 27709, USA, Tel. 1+919.549.8411, URL: standards.isa.org.

This standard was submitted to the National Committees for voting under the Fast Track Procedure as the following documents:

FDIS	Report on voting
65A/408/FDIS	65A/416/RVD

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table. In ISO, the standard has been approved by 10 P members out of 11 having cast a vote.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

IEC 62264 consists of the following parts under the general title *Enterprise-control system integration*:

Part 1: Models and terminology

Part 2: Object model attributes

Part 3: Models of manufacturing operations

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- reconfirmed;
- withdrawn;
- replaced by a revised edition, or [IEC 62264-2:2004](http://standards.iteh.ai/catalog/standards/sist/4483141f-ee33-4255-a8e4-a131d8fcb388/iec-62264-2-2004)
- amended. <https://standards.iteh.ai/catalog/standards/sist/4483141f-ee33-4255-a8e4-a131d8fcb388/iec-62264-2-2004>

A bilingual version may be issued at a later date.

## INTRODUCTION

IEC 62264 is a multi-part standard that defines the interface content between enterprise activities and control activities. This part of IEC 62264 provides the definitions of the attributes of the object models in IEC 62264-1.

IEC 62264 defines object models of exchanged information between enterprise systems and control systems. This part of IEC 62264 adds details to the object models through the definition of attributes, so that implementable interfaces may be constructed. IEC 62264 does not define models of enterprise objects or control objects.

The area of concern of this standard is strongly related to the ISO TC 184 (Industrial automation systems and integration) scope. Nevertheless the objectives and approaches are completely different and complementary. Relevant TC184 standards or work in progress address the modeling of enterprise and/or the modeling of enterprise objects whereas this standard specifies the content of interfaces between control functions and enterprise functions. The functions may be precisely modeled with TC184 standards. See ISO/IEC 62264-1 Annex A for further details.

## **iTeh STANDARD PREVIEW** **(standards.iteh.ai)**

[IEC 62264-2:2004](https://standards.iteh.ai/catalog/standards/sist/4483141f-ee33-4255-a8e4-a131d8fcb388/iec-62264-2-2004)

<https://standards.iteh.ai/catalog/standards/sist/4483141f-ee33-4255-a8e4-a131d8fcb388/iec-62264-2-2004>

## ENTERPRISE-CONTROL SYSTEM INTEGRATION –

### Part 2: Object model attributes

#### 1 Scope

This part of IEC 62264, in conjunction with IEC 62264-1, specifies generic interface content between manufacturing control functions and other enterprise functions. The interfaces considered are the interfaces between Levels 3 and 4 of the hierarchical model defined in IEC 62264-1. The goal is to reduce the risk, cost, and errors associated with implementing these interfaces.

Since IEC 62264 covers many domains, and there are many different standards in those domains, the semantics of this Standard are described at a level intended to enable the other standards to be mapped to these semantics. To this end, this Standard defines a set of generic interfaces content elements, together with a mechanism for extending those elements for implementations.

The scope of this part of IEC 62264 is limited to the definition of attributes of the IEC 62264-1 object models.

This part of IEC 62264 does not define attributes to represent the object relationships defined in IEC 62264-1.

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

#### 2 Normative references

<https://standards.iteh.ai/catalog/standards/sist/4483141f-ee33-4255-a8e4-a131d8fcb388/iec-62264-2-2004>  
IEC 62264-2:2004

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 62264-1, *Enterprise-Control System Integration – Part 1: Models and terminology*

ISO 10303-1:1994, *Industrial automation systems and integration – Product data representation and exchange – Part 1: Overview and fundamental principles*

ISO 15704:2000, *Industrial automation systems – Requirements for enterprise-reference architectures and methodologies*

#### 3 Terms and definitions

For the purpose of this document, the terms and definitions given in IEC 62264-1 as well as the following apply.

##### 3.1

##### **event**

representation of a solicited or unsolicited fact indicating a state change in the enterprise

### 3.2

#### **product**

the desired output or by-product of the processes of an enterprise

NOTE 1 A product may be an intermediate product or end product from a business perspective.

NOTE 2 Also defined in ISO 10303-1 as: 'a substance produced by a natural or artificial process'.

### 3.3

#### **property**

object denoting an implementation specific characteristic of an entity

## 4 Object model attributes

### 4.1 General

This clause describes the attributes associated with the objects listed in IEC 62264-1.

Tables 3 to 88 in Clause 4 define the attributes of objects defined in IEC 62264-1, Clause 7. The attributes are an extension to the object information model presented in IEC 62264-1 and are thus a part of the definition of terms. The attributes of this part of IEC 62264 and the object models of IEC 62264-1 define interface content for integration of Level 3 and Level 4 enterprise-control systems. See also IEC 62264-1, Clause 7.4.

In this part of IEC 62264, the word "Class" used as part of an object definition name is to be considered as a category, not as a "Class" in the object-oriented sense.

EXAMPLE "Personnel class" is to be considered a "personnel category", in the sense of distinguishing between the kinds of personnel in the real world.

A minimum set of industry-independent information has been defined, in this part of IEC 62264, as attributes. However, values for all attributes may not be required depending on the actual usage of the models. If additional information, including industry- and application-specific information, is needed, it shall be represented as property objects. This mechanism is the extension capability referenced in Clause 1. This solution increases the usability through the use of standard attributes, and allows flexibility and extensibility through the use of properties. This was done to make the standard as widely applicable as possible.

### 4.2 Attribute extensibility

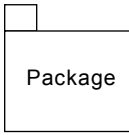

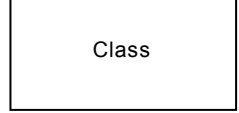

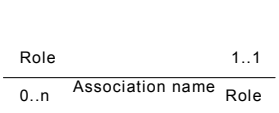

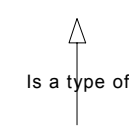

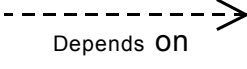

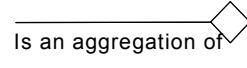

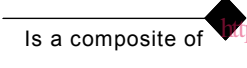

For particular applications, the objects defined in the object models will need to be extended through the addition of attributes to object class definitions. Accordingly, this part of IEC 62264 provides for attributes that are application or industry specific, to be modeled in terms of properties and represented in property classes in the model. For example, the personnel class property would be used to define application or industry specific attributes for personnel classes, and person property would be used to contain instance values for the properties.

### 4.3 Object model structure

The object models are depicted using the Unified Modelling Language (UML) notational methodology.

Table 1 defines the UML notations used in the object diagrams.

**Table 1 – UML notation used**

Symbol	Definition
 <p>Package</p>	<p>Defines a package, a collection of object models, state models, use classes, and other UML models. In this document a package is used to specify an external model, such as a production rule model, or a reference to another part of the model.</p>
 <p>Class</p>	<p>Defines a class of objects, each with the same types of attributes. Each object is uniquely identifiable or enumerable. No operations or methods are listed for the classes. Attributes with a “ - ” before their name indicate attributes that are generally optional in any use of the class.</p>
 <p>Role 1..1 0..n Association name Role</p>	<p>An association between elements of a class and elements of another or the same class. Each association is identified. May have the expected number or range of members of the subclass, when ‘n’ indicates an indeterminate number. For example, 0..n means that zero or more members of the subclass may exist.</p>
 <p>Is a type of</p>	<p>Generalization (arrow points to the super class) shows that an element of the class is a specialized type of the super class.</p>
 <p>Depends ON</p>	<p>Dependence is a weak association that shows that a modelling element depends on another modelling element. The item at the tail depends on the item at the head of the relationship.</p>
 <p>Is an aggregation of</p>	<p>Aggregation (made up of) shows that an element of the class is made up of elements of other classes.</p>
 <p>Is a composite of</p>	<p>Composite shows a strong form of aggregation, which requires that a part instance be included in at most one composite at a time and that the composite object has sole responsibility for disposition of its parts.</p>

#### 4.4 Explanation of tables

##### 4.4.1 Tables of attributes

This subclause gives the meaning of the attribute tables. This includes a listing of the object identification, data types, and presentation of the examples in the tables.

##### 4.4.2 Object identification

Many objects in the information model require unique identifications (IDs). These IDs shall be unique within the scope of the exchanged information. This may require translations:

- from the internal ID of the source system to the interface content ID;
- from the interface content ID to the internal ID of the target system.

EXAMPLE A unit may be identified as “X6777” in the interface content, as resource “R100011” in the business system, and as “East Side Reactor” in the control system.

A unique identification set shall be agreed to in order to exchange information.

The object IDs are used only to identify objects within related exchanged information sets. The object ID attributes are not global object IDs or database index attributes.

Generally, objects that are elements of aggregations, and are not referenced elsewhere in the model, do not require unique IDs.

#### 4.4.3 Data types

The attributes presented are abstract representations, without any specific data type specified. A specific implementation will show how the information is represented.

Example 1 An attribute may be represented as a string in one implementation and as a numeric value in another implementation.

Example 2 A date/time value may be represented in ISO standard format in one implementation and in Julian calendar format in another.

Example 3 A relationship may be represented by two fields (type and key) in database tables or by a specific tag in XML.

#### 4.4.4 Presentation of examples

Examples are included with each attribute given. Where multiple examples are used, there are multiple rows in the right hand column. See Table Table 2 below for how the example rows and columns are used.

**Table 2 – Example table**

Attribute name	Description	Examples
Name of first attribute	Description of first attribute	Example #1 for first attribute
		Example #2 for first attribute
		Example #3 for first attribute
Name of second attribute	Description of second attribute	Example #1 for second attribute
		Example #2 for second attribute
		Example #3 for second attribute
Name of third attribute	Description of third attribute	Example #1 for third attribute
		Example #2 for third attribute
		Example #3 for third attribute

When an example value is a set of values, or a member of a set of values, the set of values is given within a set of braces, {}.

The examples are purely fictional. They are provided to further describe attributes in the model. No attempt was made to make the examples complete or representative of any manufacturing enterprise.

#### 4.4.5 Data relationships

The models used to document a reference to a resource, in another package, using the class or instance, with additional optional specification using properties, are not fully illustrated in the IEC 62264-1 object model figures. This relationship does not conform to the Unified Modeling Language (UML) modeling methodology, but was done to keep the diagrams simpler. Figure 1 illustrates how it is currently presented, on the left side, and how it could be more accurately modeled in UML on the right side. UML was used in this standard as a visualization method and not meant to describe implementations. The simplified relationship diagram method is used for the following objects and their relationship to another package:
