THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

ISO/CEN PARALLEL PROCESSING

This draft has been developed within the International Organization for Standardization (ISO), and processed under the **ISO lead** mode of collaboration as defined in the Vienna Agreement.

This draft is hereby submitted to the ISO member bodies and to the CEN member bodies for a parallel five month enquiry.

Should this draft be accepted, a final draft, established on the basis of comments received, will be submitted to a parallel two-month approval vote in ISO and formal vote in CEN.

To expedite distribution, this document is circulated as received from the committee secretariat. ISO Central Secretariat work of editing and text composition will be undertaken at publication stage.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 5840-1 was prepared by Technical Committee ISO/TC 150, *Implants for surgery*, Subcommittee SC 2, *Cardiovascular implants and extracorporeal systems*.

[SIST EN ISO 5840-1:2015](https://standards.iteh.ai/catalog/standards/sist/666acbd5-99db-44c9-9e46-f27bd485dd81/sist-en-iso-5840-1-2015)

Introduction

There is, as yet, no heart valve substitute which can be regarded as ideal.

This International Standard has been prepared by a group well aware of the issues associated with heart valve substitutes and their development. In several areas, the provisions of this International Standard deliberately have not been specified to encourage development and innovation. It does specify types of tests, test methods, and/or requirements for test apparatus, and requires documentation of test methods and results. The areas with which this International Standard are concerned are those which will ensure that associated risks to the patient and other users of the device have been adequately mitigated, facilitate quality assurance, aid the clinician in choosing a heart valve substitute, and ensure that the device will be presented at the operating table in convenient form. Emphasis has been placed on specifying types of *in vitro* testing, on preclinical *in vivo* and clinical evaluations, on reporting of all *in vitro*, preclinical *in vivo*, and clinical evaluations and on the labelling and packaging of the device. Such a process involving *in vitro*, preclinical *in vivo*, and clinical evaluations is intended to clarify the required procedures prior to market release and to enable prompt identification and management of any subsequent problems.

With regard to *in vitro* testing and reporting, apart from basic material testing for mechanical, physical, chemical, and biocompatibility characteristics, this International Standard also covers important hydrodynamic and durability characteristics of heart valve substitutes.

The Standard does not specify exact test methods for hydrodynamic and durability testing but it offers guidelines for the test apparatus.

This International Standard is incomplete in several areas. It is intended to be revised, updated, and/or amended, as knowledge and techniques in heart valve substitute technology improve.

[SIST EN ISO 5840-1:2015](https://standards.iteh.ai/catalog/standards/sist/666acbd5-99db-44c9-9e46-f27bd485dd81/sist-en-iso-5840-1-2015)

<https://standards.iteh.ai/catalog/standards/sist/666acbd5-99db-44c9-9e46-f27bd485dd81/sist-en-iso-5840-1-2015>

Cardiovascular implants—Cardiac valve prostheses— Part 1: General requirements

1 Scope

1.1 This International Standard is applicable to heart valve substitutes intended for human implantation and provides general requirements. Subsequent parts of this International Standard provide specific requirements.

1.2 This International Standard is applicable to both newly developed and modified heart valve substitutes and to the accessories, packaging, and labelling required for their implantation and for determining the appropriate size of the heart valve substitute to be implanted.

1.3 This International Standard outlines an approach for qualifying the design and manufacture of a heart valve substitute through risk management. The selection of appropriate qualification tests and methods are derived from the risk assessment. The tests may include those to assess the physical, chemical, biological, and mechanical properties of heart valve substitutes and of their materials and components. The tests may also include those for pre-clinical *in vivo* evaluation and clinical evaluation of the finished heart valve substitute.

1.4 This International Standard defines operational conditions for heart valve substitutes.

1.7 This International Standard excludes homografts.

NOTE—A rationale for the provisions of this International Standard is given in Annex A.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

accessories

device-specific tools that are required to assist in the implantation of the heart valve substitute

3.2

adverse event

AE

untoward medical occurrence in a study subject which does not necessarily have to have a causal relationship with study treatment

NOTE 1 to entry: An AE can be an unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease, temporary or permanent, whether or not related to the prosthetic valve implantation or procedure.

3.3

actuarial methods

statistical technique for calculating event rates over time

NOTE 1 to entry: Standard actuarial methods calculate the probability of freedom from events within pre-specified intervals of time. When the intervals approach zero width, the methods are called Kaplan-Meier methods.

3.4

arterial end diastolic pressure

minimum value of the arterial pressure during diastole

3.5

arterial peak systolic pressure

maximum value of the arterial pressure during systole

3.6

back pressure

differential pressure applied across the valve during the closed phase

3.7

body surface area

BSA

total surface area (m²) of the human body

NOTE 1 to entry: This can be calculated (Mosteller's formula) as the square root of the product of the weight in kg times the height in cm divided by 3600. See Mosteller, RD.

3.8

cardiac index

cardiac output (CO, l/min) divided by the body surface area (BSA, m²), with units l/min/m²

3.9 cardiac output

stroke volume times heart rate

3.10**closing volume**

portion of the regurgitant volume that is associated with the dynamics of valve closure during a single cycle

NOTE 1 to entry: See Figure 1.

3.11**coating**

thin-film material that is applied to an element of a heart valve system to modify its physical or chemical properties

3.12**compliance**

relationship between change in diameter and change in pressure of a deformable tubular structure (e.g., valve annulus, aorta, conduit), defined in this document as:

$$C = 100\% \times \frac{(r_2 - r_1) \times 100}{r_1 \times (p_2 - p_1)}$$

where

C is the compliance in units of %radial change/100 mmHg

p_1 is the diastolic pressure, in mmHg;

p_2 is the systolic pressure, in mmHg;

r_1 is the inner radius at p_1 , in millimeters;

r_2 is the inner radius at p_2 , in millimeters;

NOTE Reference ISO 25539-1.

**Key**

X time

Y flowrate

1 closing volume <https://standards.iteh.ai/catalog/standards/sist/666acbd5-99db-44c9-9e46-f27bd485dd81/sist-en-iso-5840-1-2015>

2 leakage volume

Figure 1 — Schematic representation of flow waveform and regurgitant volumes for one cycle

3.13**component-joining material**

material, such as a suture, adhesive or welding compound, used to assemble the components of a heart valve system

3.14**cumulative incidence**

statistical technique where events other than death can be described by the occurrence of the event over time without including death of the subjects

NOTE 1 to entry: Cumulative incidence is also known as “actual” analysis.

3.15**cycle**

one complete sequence in the action of a heart valve substitute under pulsatile-flow conditions

3.16**cycle rate**

number of complete cycles per unit of time, usually expressed as cycles per minute (cycles/min)

3.17

design verification

establishment by objective evidence that the design output meets the design input requirements

3.18

design validation

establishment by objective evidence that device specifications conform with user needs and intended use(s)

3.19

device failure

inability of a device to perform its intended function sufficient to cause a hazard

3.20

device migration

detectable movement or displacement of the heart valve substitute from its original position within the implant position, without device embolization

3.21

effective orifice area

EOA

orifice area that has been derived from flow and pressure or velocity data

For in-vitro testing, EOA is defined as:

$$EOA = \frac{q_{v\ RMS}}{51,6 * \sqrt{\frac{\Delta p}{\rho}}}$$

SIST EN ISO 5840-1:2015

<https://standards.iteh.ai/catalog/standards/sist/666acbd5-99db-44c9-9e46-f27bd485dd81/sist-en-iso-5840-1-2015>

where

EOA is the Effective Orifice Area (cm²);

$q_{v\ RMS}$ is the root mean square forward flow (ml/s) during the positive differential pressure period;

Δp is the mean pressure difference (measured during the positive differential pressure period) (mmHg);

ρ is the density of the test fluid (g/cm³).

3.22

prosthetic valve endocarditis

any infection involving a valve in which an operation has been performed, based on reoperation, autopsy or the Duke Criteria for Endocarditis

NOTE 1 to entry: See Li et al (2000).

3.23

failure mode

mechanism of device failure

NOTE 1 to entry: Support structure fracture, calcification, and prolapse are examples of failure modes.

3.24

flexible surgical heart valve substitute

surgical heart valve substitute wherein the occluder is flexible under physiological conditions

NOTE 1 to entry: The orifice ring may or may not be flexible.

3.25

follow-up

continued assessment of patients who have received the heart valve substitute

3.26

forward flow volume

volume of flow ejected through the heart valve substitute in the forward direction during one cycle

3.27

fracture

disruption, under the action of applied stress or strain, of any part of the heart valve substitute that was previously intact

3.28

heart valve substitute

device used to replace the function of a natural valve of the heart

3.29

implant site/implant position

intended location of heart valve substitute implantation or deployment

3.30

intended use

use of a product or process in accordance with the specifications, instructions, and information provided by the manufacturer

3.31

leakage volume

portion of the regurgitant volume which is associated with leakage during the closed phase of a valve in a single cycle and is the sum of the transvalvular leakage volume and paravalvular leakage volume

NOTE 1 to entry: The point of separation between the closing and leakage volumes is obtained according to a defined and stated criterion (the linear extrapolation shown in Figure 1 is just an example).

3.32

linearized rate

total number of events divided by the total time under evaluation

NOTE 1 to entry: Generally, the rate is expressed in terms of percent per patient year.

3.33

major bleeding

any episode of major internal or external bleeding that causes death, hospitalization, or permanent injury (e.g. vision loss) or necessitates transfusion

3.34

mean arterial pressure

time-averaged arithmetic mean value of the arterial pressure during one cycle

3.35

mean pressure difference / mean pressure gradient

time-averaged arithmetic mean value of the pressure difference across a heart valve substitute during the forward-flow phase of the cycle

3.36

nonstructural valve dysfunction

abnormality extrinsic to the heart valve substitute that results in stenosis, regurgitation and/or haemolytic anemia

3.37

occluder/leaflet

component that inhibits backflow

3.38

outflow tract profile height

maximum distance that the heart valve substitute extends axially into the outflow tract in the open or closed position, whichever is greater, measured from the valve structure intended to mate with the top (atrial or aortic/pulmonic side) of the patient's annulus

3.39

pannus

ingrowth of tissue onto the heart valve substitute which may interfere with normal functioning

3.40

paravalvular leakage volume

portion of the leakage volume that is associated with leakage around the closed heart valve substitute during a single cycle

3.41

profile height

maximal axial dimension of a heart valve substitute in the open or closed position, whichever is greater

3.42

reference valve

heart valve substitute with a known clinical experience used for comparative preclinical and clinical evaluations

NOTE 1 to entry: The reference valve should be legally marketed and approximate the test heart valve substitute in type, configuration, and tissue annulus diameter; it may be an earlier model of the same valve, if it fulfils the necessary conditions. The characteristics of the reference valve should be well documented with clinical data.

3.43

regurgitant fraction

regurgitant volume expressed as a percentage of the forward flow volume

3.44

regurgitant volume

volume of fluid that flows through a heart valve substitute in the reverse direction during one cycle and is the sum of the closing volume and the leakage volume

NOTE 1 to entry: See Figure 1.

3.45

rigid surgical heart valve substitute

surgical heart valve substitute wherein the occluder(s) and orifice ring are non-flexible under physiological conditions

3.46

risk

combination of the probability of occurrence of harm and the severity of that harm

NOTE 1 to entry: Adapted from ISO 14971

3.47

risk analysis

systematic use of available information to identify hazards and to estimate the associated risks
