## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

---

## Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Electronic Signatures and Infrastructures (ESI).

---

## Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

---

## Introduction

Several aspects are important to ensure trust in digital signatures. Their successful implementation in electronic processes requires standards for related services, processes, systems and products as well as guidance for conformity assessment of such services, processes, systems and products.

NOTE 1: Regulation (EU) No 910/2014 [i.1] defines the terms electronic signature, advanced electronic signature, qualified electronic signature, electronic seal, advanced electronic seal and qualified electronic seal. These electronic signatures and seals can be created using digital signature technology.

NOTE 2: When not stated otherwise in the present document, "signature" denotes "digital signature".

The different players and the environment of the signature creation, validation and augmentation follow rules to allow them to be trusted. The present document concentrates on policy and security requirements to consider when creating, validating and augmenting signature in a trustworthy manner, in particular within the context of applications for signature creation, signature validation and signature augmentation.

---

# 1 Scope

The present document provides general security and policy requirements for applications for signature creation, validation and augmentation.

The present document is primarily relevant to the following actors:

- Implementers and providers of applications for signature creation, signature validation and/or signature augmentation, who need to ensure that relevant requirements are covered.
- Actors that integrate applications for signature creation, signature validation and/or signature augmentation components with business process software (or use standalone software), who want to ensure proper functioning of the overall signature creation/validation/augmentation process and that the signature creation/validation is done in a sufficiently secure environment.

The present document is applicable to these actors, and their evaluators (for a self-evaluation or an evaluation by a third party) to have a list of criteria against which to check the implementation.

The requirements cover applications for signature creation, signature validation and/or signature augmentation, i.e. the implementation and provision of the Signature Creation/Validation/Augmentation Application modules (SCA/SVA/SAA), the driving application (DA), the communication between the SCA and the signature creation device (SCDev) and the environment in which the SCA/SVA/SAA is used. It also specifies user interface requirements, while the user interface can be part of the SCA/SVA/SAA or of the DA which calls the SCA/SVA/SAA. Any entity using SCA/SVA/SAA components in its business process acts as driving application.

The document covers:

- Legal driven policy requirements.
- Information security (management system) requirements.
- Signature creation, signature validation and signature augmentation processes requirements.
- Development and coding policy requirements.
- General requirements.

Protection Profiles (PP) for signature creation applications and signature validation applications are out of scope and are defined in the CEN standard "Protection Profiles for Signature Creation & Validation Applications" [i.9].

General requirements for trust service providers are provided in ETSI EN 319 401 [i.24]. Requirements for trust service providers providing signature creation or validation services are out of scope. Requirements on trust service providers providing signature creation services are to be defined in ETSI TS 119 431 [i.22], with CEN EN 419 241 [i.21] defining requirements for a remote signature creation device. Requirements on trust service providers providing signature validation services are to be defined in ETSI TS 119 441 [i.23].

## 2 References

### 2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <https://docbox.etsi.org/Reference/>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

Not applicable.

## 2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

- [i.1] Regulation (EU) No 910/2014 of the European Parliament and of the Council on electronic identification and trust services for electronic transactions in the internal market and repealing Directive 1999/93/EC.
- [i.2] Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data.
- [i.3] ISO/IEC 15504: "Information technology -- Process assessment".

## 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in ETSI TR 119 001 [i.7] and the following apply:

NOTE: For the sake of readability, the following definitions are reproduced here below.

**advanced electronic seal:** As defined in Regulation (EU) No 910/2014 [i.1].

**advanced electronic signature:** As defined in Regulation (EU) No 910/2014 [i.1].

**certificate:** public key of an entity, together with some other information, rendered unforgeable by digital signature with the private key of the certification authority which issued it

**certificate validation:** process of verifying and confirming that a certificate is valid

**data to be signed formatted:** data created from the data to be signed objects by formatting them and placing them in the correct sequence for the computation of the data to be signed representation

**data to be signed representation:** hash of the data to be signed formatted, which is used to compute the digital signature value

**digital signature:** data appended to, or a cryptographic transformation of a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery e.g. by the recipient.

**digital signature value:** result of the cryptographic transformation of a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery e.g. by the recipient

**driving application:** application that uses a signature creation system to create a signature or a signature validation application in order to validate digital signatures or a signature augmentation application to augment digital signatures

**personal data:** any information relating to an identified or identifiable natural person ('data subject')

**signature application practice statement:** set of rules applicable to the application and/or its environment implementing the creation, the augmentation and/or the validation of digital signatures

**signature augmentation:** process of incorporating to a digital signature information aiming to maintain the validity of that signature over the long term

**signature augmentation application:** application that implements signature augmentation

NOTE 1: The signature augmentation application takes inputs from and provides the augmented signature to a driving application.

NOTE 2: The signature augmentation application can be implemented as part of the signature creation application or as part of the signature validation application or as a stand-alone application.

**signature augmentation policy:** set of rules, applicable to one or more digital signatures, that defines the technical and procedural requirements for their augmentation, in order to meet a particular business need, and under which the digital signature(s) can be determined to be conformant

**signature class:** set of signatures achieving a given functionality

NOTE 1: ETSI TS 119 102-1 [i.8] describes different signature classes.

NOTE 2: A signature class is implementation independent.

EXAMPLE: Signature with time, signature with long term validation material, Signature providing Long Term Availability and Integrity of Validation Material are possible signature classes.

**signature creation application:** application within the signature creation system, complementing the signature creation device, that creates a signature data object

**signature creation data:** unique data, such as codes or private cryptographic keys, which are used by the signer to create a digital signature value

**signature creation device:** configured software or hardware used to implement the signature creation data and to create a digital signature value

**signature creation system:** overall system, consisting of the signature creation application and the signature creation device, that creates a digital signature

**signature level:** format specific definition of a set of data incorporated into a digital signature, which allows to implement a signature class

EXAMPLE: CAdES-B-B, CAdES-E-EPES [i.15] and [i.16], XAdES-B-LTA, XAdES-E-C [i.17] and [i.18], PAdES-B-T, PAdES-E-LTV [i.19] and [i.20] are examples of signature levels.

**signature policy:** signature creation policy, a signature augmentation policy, a signature validation policy or any combination thereof, applicable to the same signature or set of signatures

**signature validation:** process of verifying and confirming that a signature is valid

**signature validation application:** application that implements signature validation

NOTE: The signature validation application takes inputs from and provides validation results to a driving application.

**signature verification:** process of checking the cryptographic value of a signature using signature verification data

**signature verification data:** data, such as codes or public cryptographic keys, used for the purpose of verifying a signature

**signed data object:** data structure containing the signature value, signature attributes and other information

**signer:** entity being the creator of a digital signature

**time-stamping authority:** trust service provider which issues time-stamps using one or more time-stamping units

**trust service:** electronic service which enhances trust and confidence in electronic transactions

**trust service provider:** natural or a legal person who provides one or more trust services

**trusted path:** connection that provides integrity, authenticity and confidentiality of the data transmitted

## 3.2 Abbreviations

For the purposes of the present document, the abbreviations given in ETSI TR 119 001 [i.7] and the following apply:

CA	Certification Authority
CRL	Certificate Revocation List
DA	Driving Application
DN	Distinguished Name
DTBS	Data to be Signed
DTBSR	Data To Be Signed Representation
EC	European Commission
ICS	Implementation Conformance Statement
ISMS	Controls (Information Security Management System)
OCSP	Online Certificate Status Provider
OTP	One Time Password
PIN	Personal Identification Number
PUK	Personal Unblocking Key
PW	Password
SAA	Signature Augmentation Application
SAPS	Signature Application Practice Statement
SCA	Signature Creation Application
SCD	Signature Creation Data
SCDev	Signature Creation Device
SD	Signer's Document
SDO	Signed Data Object
SSI	SCDev/SCA interface
SVA	Signature Validation Application
ToC	Table of Content
XML	eXtensible Markup Language

---

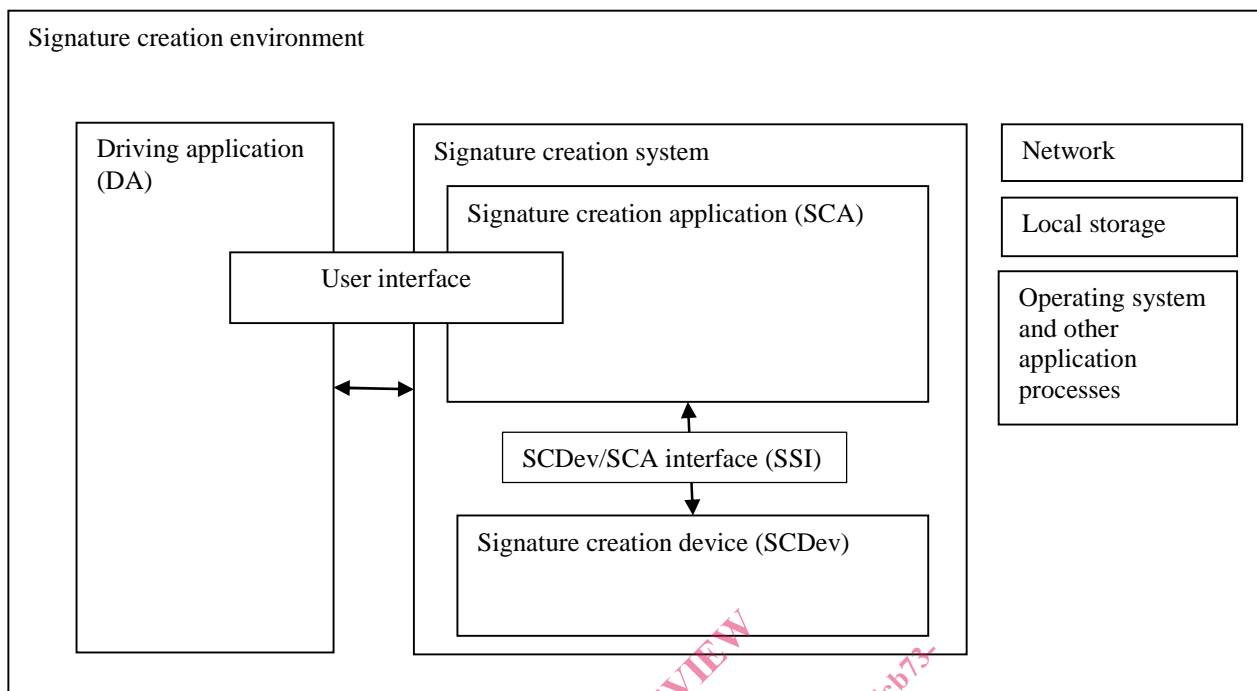

## 4 Signature creation/validation/augmentation model

The hardware/software systems for creating, validating or augmenting a signature, are modelled through several building blocks as shown in figures 1 to 3.

Some objectives can be implemented either by the DA or the SVA/SCA/SAA. This is to allow a flexibility in the implementation. However, a complete system meets all mandatory objectives (see clause 5.3) independent of where implemented.

NOTE 1: The distinction between the SCA/SVA/SAA and DA is done to simplify the definition of requirements. In concrete implementations, this distinction may not be made.

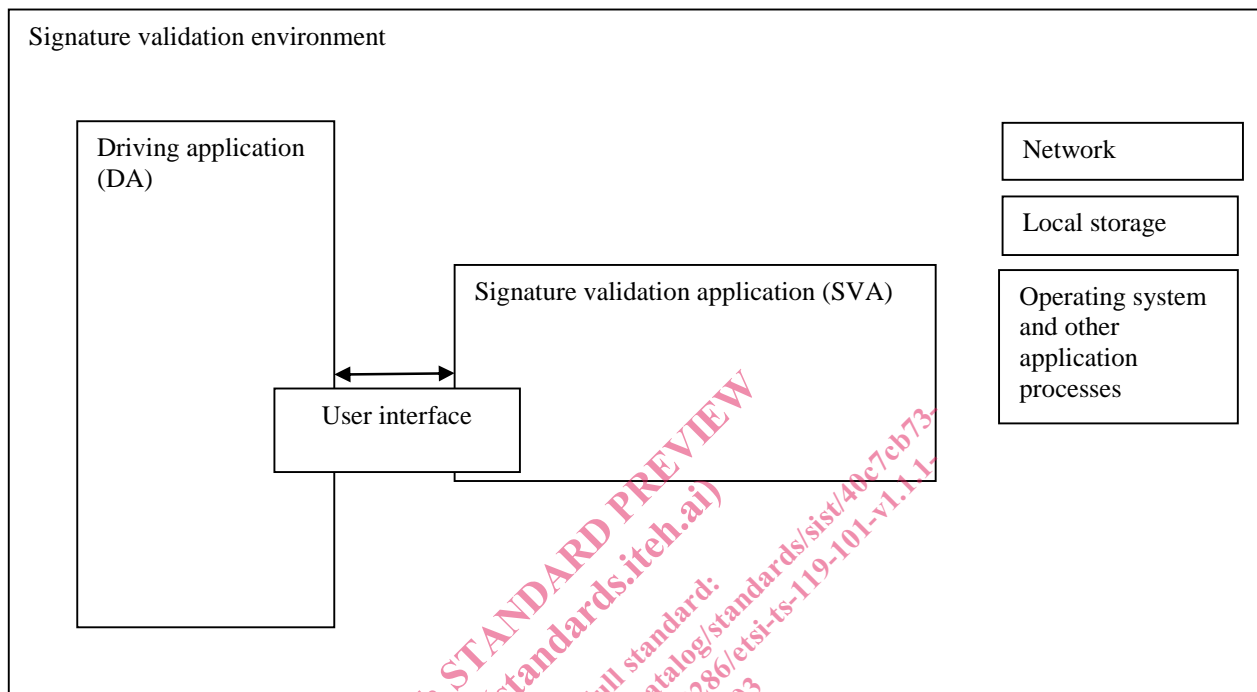

EXAMPLE: A SCA does not necessarily have a user interface, e.g. when signature creation is provided as a remote service. In this case user interaction, like selection of a signature creation policy, is implemented by the DA.

NOTE: This model is based on ETSI TS 119 102 [i.8] and differs slightly from the model used in CEN EN 419 111 [i.9]. It allows the user to communicate with the Driving Application and with the SCA. It also uses signature creation system to group together the SCA and the SCDev.

**Figure 1: Basic model of an example signature creation environment**

In case of a signature creation, the signature creation application (SCA) prepares the document to be signed and creates the signed data object from the digital signature value received from the signature creation device (SCDev). The digital signature value is created using the signature creation data of the user. The SCA communicates with the SCDev using the SSI. The driving application provides the input to the signature creation application and receives the output. The user interface can be (partly) part of the DA and/or (partly) part of the SCA. The signature creation environment covers the environment in which the DA, the SCA and the SCDev are used. It contains network, data storage and the information system.

NOTE: This model is based on ETSI TS 119 102 [i.8] and differs slightly from the model used in CEN EN 419 111 [i.9]. It allows the user to communicate with the Driving Application and with the SCA.

**Figure 2: Basic model of an example signature validation environment**

In the case of a signature validation, the DA provides the input for the SVA and receives the output. Again, the user interface can be part of the DA and/or part of the SVA. The signature validation environment covers the environment in which the DA and the SVA are used. It contains network, data storage and the information system.
