Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This European Standard (EN) has been produced by ETSI Technical Committee Electronic Signatures and Infrastructures (ESI).

The present document is part 1 of a multi-part deliverable covering CAdES digital signatures, as identified below:

Part 1: "Building blocks and CAdES baseline signatures";

Part 2: "Extended CAdES signatures".

The present document partly contains an evolved specification of the ETSI TS 101 733 [1] and ETSI TS 103 173 [i.1].

iTeh STANDARD REVIEW	
Date of adoption of this EN:	(standards.iteh.ai) 1 April 2016
Date of latest announcement of this EN (doa):	31 July 2016
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	SIST EN 319 122-1 V1.1.1:2016 https://standards.iteh.ai/catalog/standards/sist/2452978d-1411-4a42-aee8-35253e349bd3/sist-en-319-122-1-v1-1-1-2016 31 January 2017
Date of withdrawal of any conflicting National Standard (dow):	31 January 2017

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

Introduction

Electronic commerce has emerged as a frequent way of doing business between companies across local, wide area and global networks. Trust in this way of doing business is essential for the success and continued development of electronic commerce. It is therefore important that companies using this electronic means of doing business have suitable security controls and mechanisms in place to protect their transactions and to ensure trust and confidence with their business partners. In this respect digital signatures are an important security component that can be used to protect information and provide trust in electronic business.

The present document is intended to cover digital signatures supported by PKI and public key certificates, and aims to meet the general requirements of the international community to provide trust and confidence in electronic transactions, including, amongst other, applicable requirements from Regulation (EU) No 910/2014 [i.13].

The present document can be used for any transaction between an individual and a company, between two companies, between an individual and a governmental body, etc. The present document is independent of any environment. It can be applied to any environment e.g. smart cards, GSM SIM cards, special programs for electronic signatures, etc.

The present document is part of a rationalized framework of standards (see ETSI TR 119 000 [i.2]). See ETSI TR 119 100 [i.4] for getting guidance on how to use the present document within the aforementioned framework.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[SIST EN 319 122-1 V1.1.1:2016](#)

<https://standards.iteh.ai/catalog/standards/sist/2452978d-1411-4a42-aee8-35253e349bd3/sist-en-319-122-1-v1-1-1-2016>

1 Scope

The present document specifies CAdES digital signatures. CAdES signatures are built on CMS signatures [7], by incorporation of signed and unsigned attributes, which fulfil certain common requirements (such as the long term validity of digital signatures, for instance) in a number of use cases.

The present document specifies the ASN.1 definitions for the aforementioned attributes as well as their usage when incorporating them to CAdES signatures.

The present document specifies formats for CAdES baseline signatures, which provide the basic features necessary for a wide range of business and governmental use cases for electronic procedures and communications to be applicable to a wide range of communities when there is a clear need for interoperability of digital signatures used in electronic documents.

The present document defines four levels of CAdES baseline signatures addressing incremental requirements to maintain the validity of the signatures over the long term, in a way that a certain level always addresses all the requirements addressed at levels that are below it. Each level requires the presence of certain CAdES attributes, suitably profiled for reducing the optionality as much as possible.

Procedures for creation, augmentation and validation of CAdES digital signatures are out of scope and specified in ETSI EN 319 102-1 [i.5]. Guidance on creation, augmentation and validation of CAdES digital signatures including the usage of the different properties defined in the present document is provided in ETSI TR 119 100 [i.4].

The present document aims at supporting digital signatures in different regulatory frameworks.

NOTE: Specifically, but not exclusively, CAdES digital signatures specified in the present document aim at supporting electronic signatures, advanced electronic signatures, qualified electronic signatures, electronic seals, advanced electronic seals, and qualified electronic seals as per Regulation (EU) No 910/2014 [i.13].

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in ETSI TR 119 001 [i.3] and the following apply:

CAdES signature: digital signature that satisfies the requirements specified within ETSI EN 319 122 part 1 or part 2 [i.6]

Certificate Revocation List (CRL): signed list indicating a set of public key certificates that are no longer considered valid by the certificate issuer

digital signature: data appended to, or a cryptographic transformation (see cryptography) of a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery e.g. by the recipient

digital signature value: result of the cryptographic transformation of a data unit that allows a recipient of the data unit to prove the source and integrity of the data unit and protect against forgery e.g. by the recipient

electronic time-stamp: data in electronic form which binds other electronic data to a particular time establishing evidence that these data existed at that time

NOTE: In the case of IETF RFC 3161 [4] protocol, the electronic time-stamp is referring to the timeStampToken field within the TimeStampResp element (the TSA's response returned to the requesting client).

Legacy CAdES 101 733 signature: digital signature generated according to ETSI TS 101 733 [1]

Legacy CAdES baseline signature: digital signature generated according to ETSI TS 103 173 [i.1]

Legacy CAdES signature: legacy CAdES 101 733 signature or a legacy CAdES baseline signature

signature augmentation policy: set of rules, applicable to one or more digital signatures, that defines the technical and procedural requirements for their augmentation, in order to meet a particular business need, and under which the digital signature(s) can be determined to be conformant

signature creation policy: set of rules, applicable to one or more digital signatures, that defines the technical and procedural requirements for their creation, in order to meet a particular business need, and under which the digital signature(s) can be determined to be conformant

signature policy: signature creation policy, signature augmentation policy, signature validation policy or any combination thereof, applicable to the same signature or set of signatures

signature validation policy: set of rules, applicable to one or more digital signatures, that defines the technical and procedural requirements for their validation, in order to meet a particular business need, and under which the digital signature(s) can be determined to be valid

validation data: data that is used to validate a digital signature

THE STANDARD PREVIEW

3.2 Abbreviations (standards.iteh.ai)

For the purposes of the present document, the abbreviations given in ETSI TR 119 001 [i.3] and the following apply:

ATSV2 archive-time-stamp attribute
<https://taskforce.iteh.ai/catalog/standards/sist/2452978d-1411-4a42-aee8-35253e349bd3/sist-en-319-122-1-v1-1-1-2016>

NOTE: As defined in clause A.2.4.

ATSV3 archive-time-stamp-v3 attribute

NOTE: As defined in clause 5.5.3.

4 General syntax

4.1 General requirements

CAdES signatures shall build on Cryptographic Message Syntax (CMS), as defined in IETF RFC 5652 [7], by incorporation of signed and unsigned attributes as defined in clause 5.1.

CAdES signatures shall comply with clauses 2, 3, 4 and 5 of IETF RFC 5652 [7].

The following clauses list the types that are used in the attributes described in clause 5.1.

4.2 The data content type

The data content type shall be as defined in CMS (IETF RFC 5652 [7], clause 4). It is used to refer to arbitrary octet strings.

NOTE: The data content type is identified by the object identifier id-data OBJECT IDENTIFIER ::= { iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs7(7) 1 }.

4.3 The signed-data content type

The signed-data content type shall be as defined in CMS (IETF RFC 5652 [7], clause 5). It represents the content to sign and one or more signature values.

4.4 The SignedData type

The SignedData type shall be as defined in CMS (IETF RFC 5652 [7], clause 5.1). The CMSVersion shall be set to either 1 or 3 as specified in clause 5.1 of IETF RFC 5652 [7].

SignedData.xxx refers to the element xxx within the SignedData type, like for example SignedData.certificates, or SignedData.crls. In the same way, if xxx is of type XXX, SignedData.xxx.yyy is used to refer to the element yyy of type XXX, like for example SignedData.crls.crl or SignedData.crls.other.

NOTE: Clause 5.1 of IETF RFC 5652 [7] requires that the CMS SignedData version be set to 3 if certificates from SignedData is present AND (any version 1 attribute certificates are present OR any SignerInfo structures are version 3 OR eContentType from encapsContentInfo is other than id-data). Otherwise, the CMS SignedData version is required to be set to 1.

4.5 The EncapsulatedContentInfo type

The EncapsulatedContentInfo type shall be as defined in CMS (IETF RFC 5652 [7], clause 5.2).

For the purpose of long-term validation, either the eContent should be present, or the data that is signed should be archived in such a way as to preserve any data encoding.

IN STANDARD PREVIEW

NOTE 1: It is important that the OCTET STRING used to generate the signature remains the same every time either the verifier or an arbitrator validates the signature.

NOTE 2: The eContent is optional in [CMS EN 319 122-1 V1.1.1:2016](#)

<https://standards.iteh.ai/catalog/standards/sist/2452978d-1411-4a42-ace8->

- When it is present, this allows the signed data to be encapsulated in the SignedData structure which then contains both the signed data and the signature. However, the signed data can only be accessed by a verifier able to decode the ASN.1 encoded SignedData structure.
- When it is missing, this allows the signed data to be sent or stored separately from the signature, and the SignedData structure only contains the signature. Under these circumstances, the data object that is signed needs to be stored and distributed in such a way as to preserve any data encoding.

4.6 The SignerInfo type

The SignerInfo type of the digital signature shall be as defined in CMS (IETF RFC 5652 [7], clause 5.3).

The per-signer information is represented in the type SignerInfo. In the case of multiple parallel signatures, there is one instance of this field for each signer.

The degenerate case where there are no signers shall not be used.

4.7 ASN.1 Encoding

4.7.1 DER

Distinguished Encoding Rules (DER) for ASN.1 types shall be as defined in Recommendation ITU-T X.690 [17].

4.7.2 BER

If Basic Encoding Rules (BER) are used for some ASN.1 types, it shall be as defined in Recommendation ITU-T X.690 [17].

4.8 Other standard data structures

4.8.1 Time-stamp token format

The `TimeStampToken` type shall be as defined in IETF RFC 3161 [4] and updated by IETF RFC 5816 [9].

NOTE: Time-stamp tokens are profiled in ETSI EN 319 422 [i.9].

4.8.2 Additional types

The `VisibleString`, `BMPString`, `IA5String`, `GeneralizedTime` and `UTCTime` types shall be as defined in Recommendation ITU-T X.680 [16].

The `DirectoryString` type shall be as defined in Recommendation ITU-T X.520 [15].

The `AttributeCertificate` type shall be as defined in IETF RFC 5755 [8] which is compatible with the definition in Recommendation ITU-T X.509 [i.18].

The `ResponderID`, `OCSPResponse` and `BasicOCSPResponse` types shall be as defined in IETF RFC 6960 [14].

The `Name`, `Certificate` and `AlgorithmIdentifier` types shall be as defined in IETF RFC 5280 [6].

The `Attribute` type shall be as defined in IETF RFC 5280 [6] which is compatible with the definition in Recommendation ITU-T X.501 [i.17].

The `CertificateList` type shall be as defined in IETF RFC 5280 [6] which is compatible with the X.509 v2 CRL syntax in Recommendation ITU-T X.509 [i.18].

4.9 Attributes

SIST EN 319 122-1 V1.1.1:2016

Clause 5 provides details on attributes specified within CMS (IETF RFC 5652 [7]), ESS (IETF RFC 2634 [3] and IETF RFC 5035 [5]), and defines new attributes for building CAES signatures.

The clause distinguishes between two main types of attributes: signed attributes and unsigned attributes. The first ones are attributes that are covered by the digital signature value produced by the signer using his/her private key, which implies that the signer has processed these attributes before creating the signature. The unsigned attributes are added by the signer, by the verifier or by other parties after the production of the signature. They are not secured by the signature in the `SignerInfo` element (the one computed by the signer); however they can be actually covered by subsequent times-stamp attributes.

Signed and unsigned attributes are stored, respectively, in the `signedAttrs` and `unsignedAttrs` fields of `SignerInfo` (see clause 4.6).

5 Attribute semantics and syntax

5.1 CMS defined basic signed attributes

5.1.1 The content-type attribute

Semantics

The `content-type` attribute is a signed attribute.

The `content-type` attribute indicates the type of the signed content.

Syntax

The content-type attribute shall be as defined in CMS (IETF RFC 5652 [7], clause 11.1).

NOTE: As stated in IETF RFC 5652 [7], the content of ContentType (the value of the attribute content-type) is the same as the eContentType of the EncapsulatedContentInfo value being signed.

5.1.2 The message-digest attribute

Semantics

The message-digest attribute is a signed attribute.

The message-digest attribute specifies the message digest of the content being signed.

Syntax

The message-digest attribute shall be as defined in CMS (IETF RFC 5652 [7], clause 11.2).

The message digest calculation process shall be as defined in CMS (IETF RFC 5652 [7], clause 5.4).

5.2 Basic attributes for CAdES signatures

5.2.1 The signing-time attribute

Semantics

The signing-time attribute is a signed attribute.

ITeh STANDARD PREVIEW

The signing-time attribute shall specify the time at which the signer claims to having performed the signing process.

Syntax

[SIST EN 319 122-1 V1.1.1:2016](#)

<https://standards.iteh.ai/catalog/standards/sist/2452978d-1411-4a42-ace8-52253c5490d3/sist-en-319-122-1-v1-1-1-2016-04>

The signing-time attribute shall be as defined in CMS ([IETF RFC 5652 \[7\]](#), clause 11.3).

The signing-time attribute shall be as defined in CMS ([IETF RFC 5652 \[7\]](#), clause 11.3).

5.2.2 Signing certificate reference attributes

5.2.2.1 General requirements

Semantics

The attributes specified in clauses below shall contain one reference to the signing certificate.

The attributes specified in clauses below may contain references to some of or all the certificates within the signing certificate path, including one reference to the trust anchor when this is a certificate.

For each certificate, these attributes shall contain a digest value.

NOTE 1: For instance, the signature validation policy can mandate other certificates to be present which can include all the certificates up to the trust anchor.

NOTE 2: IETF RFC 2634 [3] and IETF RFC 5035 [5] state that the first certificate in the sequence is the certificate used to verify the signature and that other certificates in the sequence can be attribute certificates or other certificate types.

5.2.2.2 ESS signing-certificate attribute

Semantics

The ESS signing-certificate attribute is a signed attribute.

The ESS signing-certificate attribute is a signing certificate attribute using the SHA-1 hash algorithm.
