## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

Amendment 3 to ISO 3874:1997 was prepared by Technical Committee ISO/TC 104, *Freight containers*, Subcommittee SC 1, *General purpose containers*.

## Series 1 freight containers — Handling and securing

### AMENDMENT 3: Double stack rail car operations

Page 28

Add a new 9.3.5 after the existing 9.3.4 as follows:

#### 9.3.5 Double stack rail car operations

To ensure safe operation on double stack rail car vehicles, both the lower and the upper containers shall be supported by all four bottom corner fittings only. The bottom container shall be secured to the rail vehicle through the bottom corner fittings either by twistlocks or other means which will ensure compliance with 9.1. The upper container shall be secured to the lower container through the bottom corner fittings either by twistlocks or other means which will ensure compliance with 9.1. It is noted that these rail cars should always be shoved to rest during operations, i.e. "shunting" should not be allowed. An example of a securing lifting used for transport by rail and of a double stack rail vehicle is shown in Figure 29.

To ensure safe operation:

- the position of the securing devices shall be readily apparent;
- before the vehicle is moved, the securement of the container shall be checked;
- before the containers are lifted, all locking devices shall be released.

a) Overall view of a typical double stack rail car
