Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 12575-2 was prepared by Technical Committee ISO/TC 163, *Thermal performance and energy use in the built environment*, Subcommittee SC 3, *Thermal insulation products*.

ISO 12575 consists of the following parts, under the general title *Thermal insulation products — Exterior insulating systems for foundations*:

- *Part 1: Specification*
- *Part 2: Principal responsibilities of installers*
- *Part 3: Test methods*

Introduction

ISO 12575 defines a number of types of foundation insulating systems and outlines the different roles the insulation play within each system.

This part of ISO 12575 outlines the responsibilities for the installer to install the material in accordance with the manufacturer's instructions and in accordance with local regulations and to document that this has been done.

The designer has the responsibility for selecting the actual product in accordance with the minimum requirements in this specification for that type of system. The designer is required to consult the appropriate product standard for the product selected.

The manufacturer has the responsibility to produce the product according to any applicable material specification, declare that their product type meets the requirements of this standard, declare the fitness for the intended use and label the product according to this standard.

The installer is required to install the product in accordance with the manufacturer's instructions; assume the responsibilities for installation and be responsible for meeting local government regulations.

Development of this part of ISO 12575 includes a review of applicable CEN documents and CEN material is harmonized where appropriate.
