Foreword

This European Telecommunication Standard (ETS) has been produced by the European Computer Manufacturers Association (ECMA) on behalf of its members and those of the European Telecommunications Standard Institute (ETSI).

This ETS is one of a series of ECMA standards defining services and signalling protocols applicable to Private Integrated Services Networks (PISNs). The series uses the ISDN concepts as developed by the ITU-T (formerly CCITT) and is also within the framework of standards for open system interconnection as defined by ISO.

This ETS specifies the functional profile for interconnecting Radio Paging Equipment (RPE) with PISNs to permit interoperability between equipment from different vendors.

This ETS is based upon the practical experience of ECMA member companies and the results of their active and continuous participation in the work of ISO/IEC JTC1, ITU-T, ETSI and various international and national standardization bodies. It represents a pragmatic and widely based consensus.

Transposition dates	
Date of adoption	6 December 1996
Date of latest announcement of this ETS (doa):	31 March 1997
Date of latest publication of new National Standard or endorsement of this ETS (dop/e):	30 September 1997
Date of withdrawal of any conflicting National Standard (dow):	30 September 1997

1 Scope

This Profile Standard specifies the combination of base standards, together with the selection of appropriate options and parameter values, necessary to interface a Radio Paging Equipment (RPE) to a Private Integrated Services Network Exchange (PINX).

The standard provides for two methods of connection of an RPE to a PINX. With the first method, the RPE is connected in a similar manner to a TE connected at the S reference point using an ISDN basic access interface at layer 1. With the second method the RPE is connected in a similar manner to another PINX connected at the C reference point using an ISDN basic access interface or a primary rate interface at layer 1. In this case static mapping is employed between the C reference point and the Q reference point. The C, Q and S reference points are defined in ISO/IEC 11579-1 [4].

This Standard states requirements upon implementations to achieve interoperability between equipment on each side of the RPE/PINX interface.

NOTE: Implementation of one or more profiles from this Standard does not preclude a manufacturer from offering other means of interconnection.

2 Conformance

A system conforms to this Standard if it correctly performs all the mandatory capabilities defined in the requirement list (RL) and the profile specific implementation conformance statement (ICS). Note that more capabilities may be mandatory than in the base standards (annex A and B).
