This European Standard was approved by CEN on 28 September 2018.

CEN and CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN and CENELEC member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN and CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN and CENELEC members are the national standards bodies and national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

## European Foreword

---

This document (EN 16603-33-11:2019) has been prepared by Technical Committee CEN-CENELEC/TC 5 "Space", the secretariat of which is held by DIN.

This standard (EN 16603-33-11:2019) originates from ECSS-E-ST-33-11C Rev.1.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by October 2019, and conflicting national standards shall be withdrawn at the latest by October 2019.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN 14607-6:2004.

Changes to EN 14607-6:2004 that was based on ECSS-E-30 Part 6A (25 April 2000) are:

- STANDARD PREVIEW**  
(standards.iteh.ai)
- Complete edit to conform to the ECSS Drafting Rules for "ECSS Issue C standards"
  - Implementation of ECSS Change Requests and harmonization the standard with ISO in ECSS Revision 1 (2017)
  - Change of the title from "Space engineering - Mechanical - Part 6: Pyrotechnics" to "Space engineering - Explosive subsystems and devices"
  - Use of the more accurate term "explosive" rather than "pyrotechnics" in relation to the subject components and systems
  - Emphasis on reliability coupled with confidence level for performance properties
  - Inclusion of detailed requirements for the different types of explosive device
  - Emphasis on the requirement for properties of components to be agreed with the end user before commitment to purchase.

This document has been prepared under a standardization request given to CEN by the European Commission and the European Free Trade Association.

This document has been developed to cover specifically space systems and has therefore precedence over any EN covering the same scope but with a wider domain of applicability (e.g. : aerospace).

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

## Introduction

---

As any explosive item used for flight can function only once, it can never be fully tested before its crucial mission operation. The required confidence can only be established indirectly by the testing of identical items. Test results and theoretical justification are essential for demonstration of fulfilment of the requirements. The requirement for repeatability shows that product assurance plays a crucial role in support of technical aspects.

The need for statistics requires that the explosive components used in the explosive subsystem be tested and characterized extensively. The variability in components requires that manufacturers prove to customers that delivered items are identical to those qualified.

The failure or unintentional operation of an explosive item can be catastrophic for the whole mission and life threatening. Specific requirements can exist for the items associated with it. As all explosives where ever used are treated similarly, the same requirements, regulations, practices and standards need to be applied to help avoiding human error.

# 1 Scope

---

This Standard defines the requirements for the use of explosives on all spacecraft and other space products including launch vehicles. It addresses the aspects of design, analysis, verification, manufacturing, operations and safety.

This standard may be tailored for the specific characteristics and constraints of a space project in conformance with ECSS-S-ST-00.

## Terms, definitions and abbreviated terms

---

### 3.1 Terms defined in other standards

- a. For the purpose of this Standard, the terms and definitions from ECSS-S-ST-00-01 apply, in particular for the following terms:

1. lifetime

### 3.2 Terms specific to the present standard

#### 3.2.1 **all fire** (standards.iteh.ai)

stimulus with a probability of functioning equal to or better than 0,999 at 95 % confidence level

<https://standards.iteh.ai/catalog/standards/sist/f57ccfad-3397-4c90-bf7d-e640eaa0764c/sist-en-16603-33-11-2019>

#### 3.2.2 **arm plug receptacle**

connector mounted on the skin of a spacecraft that can be connected to a Safe or Test or Arm plug

#### 3.2.3 **armed**

status of an explosive subsystem when all the safety devices have been disabled and which can be triggered

[Adapted from Dictionary of explosive related terms]

#### 3.2.4 **cartridge**

explosive device designed to produce pressure for performing a mechanical function

NOTE A cartridge is called an initiator if it is the first or only explosive element in an **explosive train** (see definition 3.2.14).

#### 3.2.5 **charge**

explosive loaded in a cartridge, detonator, or separate container for use in an explosive device

#### 3.2.6 **component**

smallest functional item in an explosive subsystem

**3.2.7 deflagration**

self-sustaining, exothermic decomposition reaction of an explosive substance, whose apparent velocity is less than the velocity of sound in the substance and greater than the speed of sound in air

NOTE It is generally accepted that the energy transmission takes place via a mechanical compression wave. This type of reaction is intermediary between combustion and detonation. It differs from combustion through the presence of a significant compression wave in the surrounding environment.

[Dictionary of explosive related terms]

**3.2.8 detonation**

exothermic decomposition reaction of an explosive substance self-sustained by a shock wave, whose velocity of propagation is greater than the velocity of sound in the substance

NOTE The velocity of propagation is of the order of several thousands of m/s.

[Dictionary of explosive related terms]

**3.2.9 detonator**

initiator whose function is to transform external energy directly into a shock wave strong enough to detonate a secondary high explosive

NOTE EN External energy can be, for example, mechanical, electrical and thermal.

[Dictionary of explosive related terms]

**3.2.10 electro-explosive device**

device containing some reaction mixture that is electrically initiated

NOTE 1 The output of the initiation is heat, shock or mechanical action.

NOTE 2 The reaction mixture can be explosive or pyrotechnic.

[Dictionary of explosive related terms]

**3.2.11 end-user**

person who or organization that actually uses a product

NOTE 1 The end-user need not to be the owner or buyer.

NOTE 2 In the context of this standard the end user is generally the first level customer.

**3.2.12 energetic material**

material consisting of, or containing, an explosive, oxidizer, fuel, or combination of them, that can undergo, contribute to, or cause rapid exothermic decomposition, combustion, deflagration, or detonation

**3.2.13 explosively actuated device**

device that converts the products of explosion into useful mechanical work

NOTE 1 The explosion can be combustion, deflagration or detonation.

NOTE 2 Pyromechanisms and linear detonating separation devices are explosively actuated devices.

**3.2.14 explosive train**

series of explosive components including the initiator, explosive transfer assembly and explosively actuated device

**3.2.15 explosive component**

discrete item containing an explosive substance

**3.2.16 explosive function**

function that uses energy released from explosive substances for its operation

**3.2.17 explosive subsystem**

collection of all the explosive trains on the spacecraft or launcher system, and the interface aspects of any on-board computers, launch operation equipment, ground support and test equipment and all software associated with explosive functions

**3.2.18 fail operational**

mission capable after one failure

NOTE Maintaining operational conditions after one failure and safety conditions after a second independent failure is referred to as "Fail operational – Fail safe".

**3.2.19 fail safe**

design property of a subsystem, or part of it, which remains safe after one failure

NOTE Maintaining safety following two independent failures is referred to as "Fail safe – Fail safe".

**3.2.20 gas generators**

explosive devices that produce a volume of gas or exothermic output or both

NOTE E.g. pyrotechnic igniters for solid propulsion applications, gas generator for inflatable structures.

**3.2.21 initiator**

basic component located upstream of an explosive train, from which originates a transformation of mechanical, electrical or optical energy, the effect produced being a combustion, deflagration or detonation.

NOTE 1 It contains a small quantity of an energetic material.

NOTE 2 Examples: hot bridge wire initiator, exploding bridge wire initiator
