## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 3290-2 was prepared by Technical Committee ISO/TC 4, *Rolling bearings*.

ISO 3290 consists of the following parts, under the general title *Rolling bearings — Balls*:

- *Part 1: Steel balls*
- *Part 2: Ceramic balls*

# Rolling bearings — Balls —

## Part 2: Ceramic balls

### 1 Scope

This part of ISO 3290 specifies requirements for finished silicon nitride balls for rolling bearings.

### 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 1132-1, *Rolling bearings — Tolerances — Part 1: Terms and definitions*

ISO 4288, *Geometrical Product Specifications (GPS) — Surface texture: Profile method — Rules and procedures for the assessment of surface texture*

ISO 5593, *Rolling bearings — Vocabulary*

ISO/TS 12181-1, *Geometrical Product Specifications (GPS) — Roundness — Part 1: Vocabulary and parameters of roundness*

ISO 15241, *Rolling bearings — Symbols for quantities*

ISO 26602:—<sup>1</sup> *Fine ceramics (advanced ceramics, advanced technical ceramics) — Silicon nitride materials for rolling bearing balls*

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 1132-1, ISO 5593 and the following apply.

#### 3.1

##### **nominal ball diameter**

diameter value which is used for the general identification of a ball size

[ISO 5593:1997, 05.04.01]

---

1) To be published.

3.2

**single ball diameter**

distance between two parallel planes tangential to the actual surface of a ball

[ISO 5593:1997, 05.04.02]

3.3

**mean ball diameter**

arithmetical mean of the largest and the smallest of the single diameters of a ball

[ISO 5593:1997, 05.04.03]

3.4

**variation of ball diameter**

difference between the largest and the smallest of the single diameters of a ball

[ISO 5593:1997, 05.04.04]

3.5

**deviation from spherical ball surface**

various types of deviation from the perfect spherical ball surface, uniformly or non-uniformly distributed and repeated around the ball surface

NOTE The deviations to which limits can be attributed are:

- deviation from spherical form;
- waviness;
- surface roughness;
- surface defect.

**iTeh STANDARD PREVIEW**  
**(standards.iteh.ai)**  
<https://standards.iteh.ai/catalog/standards/sist/2b0406d8-2f82-41cb-8d62-0fb29053a4c9/iso-3290-2-2008>

3.5.1

**deviation from spherical form**

radial distance between the smallest circumscribed sphere and the greatest inscribed sphere, with their centres common to the least squares sphere centre

NOTE This definition supersedes ISO 5593:1997, 05.06.03.

3.5.2

**waviness**

surface irregularities of random or periodical deviation from the ideal spherical form

NOTE 1 Waviness can be evaluated as velocity amplitude by default.

NOTE 2 In practice, the waviness components are separated from the real surface by a waviness analyser (filters).

3.5.3

**surface roughness**

surface irregularities with relatively small spacings, which usually include irregularities resulting from the method of manufacture being used and/or other influences

NOTE These irregularities are considered within the limits that are conventionally defined, e.g., within the limits of the sampling length.

3.5.4

**surface defect**

element, irregularity or group of elements and irregularities of the real surface, unintentionally or accidentally caused during manufacture, storage, handling or use of the surface

NOTE 1 These types of element or irregularity differ considerably from those constituting the surface roughness and are not considered during the measurement of the surface roughness.

NOTE 2 The limits for surface defects are not specified in this part of ISO 3290.

### 3.6

#### ball lot

definite quantity of balls manufactured under conditions presumed uniform and which is considered as an entity

[ISO 5593:1997, 05.04.05]

### 3.7

#### mean diameter of ball lot

arithmetical mean of the mean diameters of the largest ball and the smallest ball in a ball lot

[ISO 5593:1997, 05.04.06]

### 3.8

#### variation of ball lot diameter

difference between the mean diameters of the largest ball and the smallest ball in a ball lot

[ISO 5593:1997, 05.04.07]

### 3.9

#### ball grade

specific combination of dimensional, form, surface roughness and sorting tolerances for balls

[ISO 5593:1997, 05.04.08]

iTech STANDARD PREVIEW  
(standards.iteh.ai)

NOTE Ball grade is identified by the letter G and a number, e.g. G 20.

[ISO 3290-2:2008](https://standards.iteh.ai/catalog/standards/sist/2b0406d8-2f82-41cb-8d62-0fb29053a4c9/iso-3290-2-2008)

### 3.10

#### ball gauge

amount by which the mean diameter of ball lot should differ from the nominal ball diameter, this amount being one of an established series

[ISO 5593:1997, 05.04.09]

NOTE 1 Each ball gauge is a whole multiple of the ball gauge interval established for the ball grade in question.

NOTE 2 A ball gauge, in combination with the ball grade and nominal diameter, is considered as the most exact ball size specification to be used by a customer for ordering purposes.

### 3.11

#### deviation of a ball lot from ball gauge

difference between the mean diameter of a ball lot and the sum of the nominal ball diameter and the ball gauge

[ISO 5593:1997, 05.04.10]

### 3.12

#### ball subgauge

amount, of an established series of amounts, which is the nearest to the actual deviation from the ball gauge of a ball lot

[ISO 5593:1997, 05.04.11]

NOTE 1 Each ball subgauge is a whole multiple of the ball subgauge interval established for the ball grade in question.

NOTE 2 The ball subgauge, in combination with the nominal ball diameter and the ball gauge, is used by ball manufacturers to denote the mean diameter of a ball lot and is not generally used by customers for ordering purposes.

**3.13  
hardness**

(rolling bearings) measure of resistance to penetration as determined by a specific test method

NOTE For ceramics balls, such a test method is the Vickers hardness test.

**4 Symbols**

For the purposes of this document, the symbols given in ISO 15241 and the following apply.

The symbols (except those for tolerances) and the values given in Tables 1 to 3 denote nominal dimensions unless specified otherwise.

$D_w$  nominal ball diameter

$D_{wm}$  mean ball diameter

$D_{wmL}$  mean diameter of ball lot

$D_{ws}$  single ball diameter

G ball grade

S ball gauge

$V_{DwL}$  variation of ball lot diameter

$V_{Dws}$  variation of ball diameter

$\Delta_{RSw}$  deviation from spherical form

$\Delta_S$  deviation of a ball lot from ball gauge

NOTE  $\Delta_S = D_{wmL} - (D_w + S)$

[8fb29053a4c9/iso-3290-2-2008](https://standards.iteh.ai/catalog/standards/sist/2b0406d8-2f82-41cb-8d62-8fb29053a4c9/iso-3290-2-2008)

**5 Requirements**

**5.1 Ball size**

The preferred nominal ball diameters are given in Table 1 and, where applicable, the corresponding inch sizes are given for reference purposes only.

**5.2 Quality of geometry and surface**

Requirements for:

- variation of ball diameter, see Table 2;
- deviation from spherical form, see Table 2;
- waviness, see Note 1;
- surface roughness, see Table 2;
- surface appearance, see Notes 2 and 3.

Measurement of surface roughness shall be carried out in accordance with ISO 4288.

NOTE 1 Limits and measuring methods for waviness are subject to agreement between customer and supplier.

NOTE 2 Local inhomogeneities in colour, densification, pressing defects, snowflakes, etc. and cracks inherent to the material and its processing are subject to agreement between customer and supplier.

NOTE 3 Local defects originating from machining and handling are subject to agreement between customer and supplier.

### 5.3 Sorting accuracy and ball gauges

Table 3 comprises the applicable values for:

- variation of ball lot diameter;
- gauge interval;
- preferred gauges;
- subgauge interval;
- subgauges.

## 6 Material

The balls shall be manufactured from silicon nitride material in accordance with ISO 26602:—.

## 7 Dimensions and tolerances

The preferred nominal ball diameters are given in Table 1. Tolerances for form and surface roughness are given in Table 2. Sorting tolerances and ball gauges are given in Table 3.
