

# Standard Test Methods for Emulsified Bitumens Used as Protective Coatings<sup>1</sup>

This standard is issued under the fixed designation D 2939; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon (ε) indicates an editorial change since the last revision or reappraisal.

*This standard has been approved for use by agencies of the Department of Defense.*

*ASTM Test Methods D 2939 is the method recommended for use by Committee D-8 in place of Methods D 1010 and D 1167.*

## 1. Scope

1.1 These test methods cover procedures for sampling and testing emulsified bitumens used in relatively thick films as protective coatings for metals and built-up roofs.

1.2 The test methods appear in the following order:

Test Procedures for All Coatings	Section
Sampling	4
Uniformity	5
Resistance to Freezing	6
Weight per Gallon	7
Residue by Evaporation	8
Volatiles	9
Ash Content	10
Water Content	11
Flash Point	12
Drying Time	13
Resistance to Heat	14
Resistance to Water	15
Flexibility	16
Tests used primarily for coatings used over metals and built-up roofs	
Brush-Application Behavior	17
Spray-Application Behavior	18
Wet Flow	19
Direct-Flame Test	20
Solubility of Residue in Trichloroethylene	21
Tests used primarily for coatings used over bituminous pavements	
Wet Film Continuity	22
Resistance to Volatilization	23
Solubility of Residue in Carbon Disulfide	24
Resistance to Kerosine <sup>2</sup>	25
Resistance to Impact	26
Resistance to Impact After Accelerated Weathering	27
Aggregate (Sand) Content in Bituminous Emulsions	28
Precision & Bias	29

1.3 The values stated in SI units are to be regarded as standard. The values in parentheses are for information only.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

## 3. Significance and Use

3.1 These tests are useful in evaluating and characterizing coal tar emulsion and other bituminous emulsions to establish uniformity of shipments.

## 4. Sampling

4.1 Determine the number of containers sampled to represent a shipment in accordance with Practice D 140.

4.2 Open the original containers and examine them for uniformity of contents. Record the degree of separation, if any,

<sup>1</sup> These test methods are under the jurisdiction of ASTM Committee D-8 on Roofing, Waterproofing, and Bituminous Materials and are the direct responsibility of Subcommittee D08.09 on Bituminous Emulsions.

Current edition approved May 10, 1998. Published December 1998. Originally published as D 2939 – 70 T. Last previous edition D 2939 – 97.

<sup>2</sup> This test is intended to evaluate the relative resistance of coatings which might be exposed to fuel spills.

into portions of appreciably different consistency, such as thick or thin layers, sedimentation or coagulation, etc. Also note any difficulty encountered in stirring to a uniform condition.

4.3 Take the samples for laboratory examination from the original containers immediately after stirring to a uniform condition. Restir individual or combined samples immediately before taking out portions for tests.

## 5. Uniformity

5.1 *Procedure*—Examine the contents of a full container of not less than 1 L or 1 qt in volume that has stood undisturbed for 48 h.

5.2 *Report*—Make a notation of any separation of water, coagulation of the emulsified bitumen, or settlement of suspended matter that cannot be overcome by moderate agitation.

## 6. Resistance to Freezing

6.1 *Procedure*—Expose a representative specimen of the emulsion to a temperature of  $-18^{\circ}\text{C}$  ( $0^{\circ}\text{F}$ ) for 24 h, then warm the specimen in an environment not exceeding  $100^{\circ}\text{F}$  and stir thoroughly.

6.2 *Report*—Make a notation if the specimen was unable to return to a homogeneous consistency when stirred.

## 7. Weight per Gallon

7.1 *Apparatus*:

7.1.1 *Weight-per-Gallon Cup*,<sup>11</sup> with lid, stainless steel, calibrated to contain 83.2 g of water at  $25^{\circ} \pm 0.5^{\circ}\text{C}$  ( $77^{\circ} \pm 1^{\circ}\text{F}$ ).

7.1.2 *Balance*, accurate to 0.01 g.

7.1.3 *Water Bath*, constant temperature, maintained at  $25^{\circ} \pm 0.5^{\circ}\text{C}$  ( $77^{\circ} \pm 1^{\circ}\text{F}$ ).

7.2 *Procedure*:

7.2.1 Stir the emulsion sample, and place in the  $25^{\circ}\text{C}$  ( $77^{\circ}\text{F}$ ) water bath for a minimum of 2 h until the sample temperature reaches  $25^{\circ} \pm 0.5^{\circ}\text{C}$  ( $77^{\circ} \pm 1^{\circ}\text{F}$ ).

7.2.2 Weigh the weight-per-gallon cup with lid to the nearest 0.01 g and record as tare weight. Condition cup and lid to  $25^{\circ} \pm 0.5^{\circ}\text{C}$  ( $77^{\circ} \pm 1^{\circ}\text{F}$ ).

7.2.3 Remove the emulsion sample from the bath, and stir until homogeneous. Avoid trapping air in the sample during stirring.

7.2.4 Carefully fill the weight-per-gallon cup with the emulsion, avoiding the entrapment of air. Jar or vibrate the cup until no further change in volume occurs.

7.2.5 Immediately place the lid on the weight-per-gallon cup and remove, with a clean rag or paper, the excess emulsion oozing through the orifice in the lid.

7.2.6 When the lid is placed on tightly, clean the weight-per-gallon cup carefully, weigh on the balance to the nearest 0.01 g, and record as weight of emulsion and tare.

7.3 *Calculations*:

7.3.1 Calculate the weight per gallon of the emulsion as follows:

$$D = (B - A)/10 \quad (1)$$

where:

A = tare weight of weight-per-gallon cup, g,

B = weight of emulsion and tare, g, and

D = weight per gallon of emulsion, lb/gal.

7.3.2 Calculate the specific gravity of the emulsion as follows:

$$SG = D/8.33 \quad (2)$$

where:

SG = specific gravity,

D = weight per gallon of emulsion, calculation from 7.3.1,

8.33 = weight per gallon of water at  $25^{\circ} \pm 0.5^{\circ}\text{C}$  ( $77^{\circ} \pm 1^{\circ}\text{F}$ ).

7.4 *Report*:

7.4.1 Report the weight per gallon of the emulsion in pounds per gallon to the nearest 0.1 lb at  $25^{\circ}\text{C}$  ( $77^{\circ}\text{F}$ ).

7.4.2 Report the specific gravity of the emulsion to the nearest hundredth at  $25^{\circ}\text{C}$  ( $77^{\circ}\text{F}$ ).

## 8. Residue by Evaporation

8.1 *Apparatus*:

8.1.1 *Metal Dish*, flat-bottom, having a diameter of 65 mm (2.5 in.) with walls 10 mm ( $\frac{3}{8}$  in.) high.

8.1.2 *Oven*, forced draft, conforming to Specification E 145, Type II B.

8.1.3 *Balance*, capable of weighing 50 g to within  $\pm 0.01$  g.

8.2 *Procedure*—Weigh  $10 \pm 0.25$  g in the tared metal dish to the nearest 0.01 g. Dry the dish and its contents in a forced draft oven at  $105 \pm 2^{\circ}\text{C}$  ( $221 \pm 4^{\circ}\text{F}$ ) until the residue shows a loss of not more than 0.05 g on successive hourly weighings (approx. 4 h), after cooling in a desiccator.

8.3 *Calculation*—Calculate the percent residue by evaporation,  $R_1$ , from the mass of the dry residue and the mass of the original sample, as follows:

$$R_1 = (R/S) \times 100 \quad (3)$$

where:

R = mass of dry residue, g, and

S = mass of sample, g.

8.4 *Report*—Record the average of two determinations.<sup>12</sup>

## 9. Volatiles

9.1 *Procedure*—Determine by difference between residue by evaporation (Section 8) and 100 %.

9.2 *Calculation*—Percent volatiles =  $100 - R_1$ .

9.3 *Report*—Report as percent volatiles.

## 10. Ash Content

10.1 *Apparatus*:

10.1.1 *Porcelain Crucible*, 30 cm<sup>3</sup> capacity, or equivalent.

10.1.2 *Balance*, capable of weighing 50 g to within  $\pm 0.01$  g.

<sup>11</sup> The sole source of supply of the apparatus known to the committee at this time is Paul N. Gardner Company, Inc., 316 NE First Street, Pompano Beach, FL 33060. If you are aware of alternative suppliers, please provide this information to ASTM Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee,<sup>1</sup> which you may attend.

<sup>12</sup> In the case of coal tar emulsion: The Specification D 490 tar used to manufacture this emulsion contains some "light ends." In running the residue by evaporation test some of these light ends come off as if they are water.

10.1.3 *Muffle Furnace*, capable of maintaining a temperature of  $1100^{\circ}\text{F} \pm 10^{\circ}\text{F}$ .

10.2 *Procedure*—Thoroughly mix the dry residue from the determination of residue by evaporation (store the residue in a desiccator at all times prior to this test) (Section 8) and weigh  $3 \pm 0.5$  g to the nearest 0.01 g in a previously ignited and tared crucible. Incinerate the contents inside a muffle furnace at a temperature of  $600^{\circ}\text{C}$  ( $1110^{\circ}\text{F}$ ) to constant weight.<sup>13</sup>

10.3 *Calculation*—Calculate the ash thus obtained,  $A_r$ , as percent of the residue by evaporation as follows:

$$A_r = (A/S) \times 100 \quad (4)$$

where:

$A$  = mass of ash after ignition, g, and

$S$  = mass of sample, g.<sup>13</sup>

10.4 *Report*—Record the ash content  $A_r$ .

## 11. Water Content

11.1 *Procedure*—Determine water content in accordance with Test Method D 95.

11.2 *Report*—Report as mass percent of the emulsion.

## 12. Flash Point

12.1 *Procedure*—Prepare and test the sample in accordance with Test Methods D 93.

12.2 *Report*—Record and report the flash point if at or below  $140^{\circ}\text{F}$ .

## 13. Drying Time

13.1 *Apparatus*:

13.1.1 *Metal Panels*—Metal panels 150-mm (6-in.) square, 0.30 to 0.40 mm (28 to 30 gage) thick.

13.1.2 *Brass Mask*<sup>14</sup>—150-mm (6-in.) square, and 1.6-mm ( $1/16$ -in.) nominal thickness, with a 100-mm (4-in.) square opening in its center.

13.1.3 *Preparation of Metal Panels for Coating*—Prepare the metal panels for the application of the emulsion in accordance with Practice D 609. The panels shall be free of oil and rust or other corrosion and one face of each panel shall be lightly abraded with 00 steel wool or 00 garnet paper to a clean surface and wiped with a clean dry cloth.

13.2 *Preparation of Test Panel*—Thoroughly stir the sample of emulsion. Apply the brass mask to one metal panel so that the sides of the opening are approximately 25 mm (1 in.) from the edges of the panel, and spread the emulsion over the area within the mask opening. Doctor-off the excess level with a flat scraper so that the test film, when prepared, is the same thickness as the mask.

13.3 *Procedure*—Expose two panels prepared in accordance with 13.1.1 through 13.2 in a horizontal position at a temperature of  $73.4 \pm 3.6^{\circ}\text{F}$  and approximately 50 % relative humidity. After 24 h (in the case of coal tar emulsion test, after 8 h), test the condition of the surface of the emulsion coat by lightly rubbing with the finger. Consider the emulsion to have

reached a firm set when a light rubbing of the finger does not break, roll, or displace the surface of the coating.

13.4 *Report*—Record whether or not firm set has been attained.

## 14. Resistance to Heat

14.1 *Apparatus*—A forced draft oven with internal dimensions not less than 300 by 300 by 300 mm (12 by 12 by 12 in.) and capable of maintaining a uniform temperature of  $100 \pm 3^{\circ}\text{C}$  ( $212 \pm 5^{\circ}\text{F}$ ).

14.2 *Preparation of Test Panel*—Prepare one panel in accordance with 13.1.2 through 13.2. Allow the test panels to dry for 48 h in a horizontal position at  $73.4^{\circ} \pm 3.6^{\circ}\text{F}$ .

14.3 *Procedure*—Scratch light reference lines 25 mm (1.0 in.) apart, parallel to the original reference line across the test film, and continue them to the edges of the test panel. Suspend the test panel vertically in the oven with the reference lines horizontal, and maintain at a temperature of  $100 \pm 3^{\circ}\text{C}$  ( $212 \pm 9^{\circ}\text{F}$ ) for 2 h. At the end of the test period, examine the coating for blistering, sagging, and slipping.

14.3.1 When coal tar emulsions are tested according to this procedure, maintain the oven at a temperature of  $80 \pm 3^{\circ}\text{C}$  ( $176 \pm 5^{\circ}\text{F}$ ).

14.4 *Report*—Record any sagging of the lines within the test film or slipping of the film beyond the lower reference line.

## 15. Resistance to Water

15.1 *Method A*:

15.1.1 *Apparatus*—Use an oven as described in 8.1.2 and other equipment described in 13.1 and 13.1.3.

15.1.2 *Preparation of Test Panel*—Prepare in accordance with 13.2.

15.1.3 *Procedure*—Dry the coated panels for 24 h in a horizontal position in a forced draft circulation oven at a temperature of  $60 \pm 3^{\circ}\text{C}$  ( $140 \pm 5^{\circ}\text{F}$ ). After 24 h completely immerse the test panels in distilled water in a suitably sized glass container at  $24 \pm 3^{\circ}\text{C}$  ( $75 \pm 5^{\circ}\text{F}$ ) for 24 h.

15.1.4 *Report*—After taking the test panels out of the water, examine them for development of blistering and reemulsification as inferred from the presence of dispersed bitumen particles in the water. Record the extent of blistering or reemulsification.

15.2 *Method B - For Coal Tar Emulsions*:

15.2.1 *Apparatus*—Prepare apparatus as described in 25.1 through 25.3.3.

15.2.2 *Procedure*—After completion of curing, apply a water resistant cement to the bottom of the metal ring and press onto the coating surface. Apply more of the cement if necessary to the ring/coating joint to prevent leakage. After the cement has cured properly, fill the ring with distilled water undisturbed for 24 h maintained at a temperature of  $27 \pm 5^{\circ}\text{C}$  ( $80 \pm 10^{\circ}\text{F}$ ). At the end of the 24 h period, examine the submerged film. Determine adhesion of bond by making intersecting cuts with a knife or needle and lifting the cut film at the point of intersection. Determine reemulsification if the water becomes darkened by rubbing the submerged of the uncut film lightly with a rubber policeman.

15.2.3 *Report*—Assess and report according to the following rating guide:

<sup>13</sup> This incineration will produce black smoke. This procedure should be carried out under a fume hood.

<sup>14</sup> Other materials such as plexiglass have also been used successfully for these tests.
