Designation: F1760-01 (Reapproved 2005) ${ }^{\text {E1 }}$

# Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content ${ }^{1}$ 

#### Abstract

This standard is issued under the fixed designation F1760; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon $(\varepsilon)$ indicates an editorial change since the last revision or reapproval.

[^0]
## 1. Scope

1.1 This specification has been published in response to the special circumstance of regulatory requirements regarding federal procurement guidelines for plastic pipe having recycled content.
1.2 This specification covers coextruded Poly(Vinyl Chloride) (PVC) plastic pipe with a center layer and concentric inner and outer solid layers. The pipe is produced using a multi-layer coextrusion die. The inner and outer layers are made of virgin PVC compound and the center layer has reprocessed-recycled PVC content. The pipe is for nonpressure use in three series:
1.2.1 Sewer-Drain series with a sewer-pipe outside diameter and a pipe stiffness of $46 \mathrm{psi}(320 \mathrm{kPa})$,
1.2.2 IPS Schedule 40 series, and
1.2.3 IPS Pipe Stiffness (PS) series with pipe stiffnesses of $100 \mathrm{psi}(690 \mathrm{kPa})$ and $120 \mathrm{psi}(830 \mathrm{kPa})$.
1.3 Pipe that is outside-diameter controlled does not necessarily have an inside diameter suitable for use as a fitting socket.
1.4 All series may be perforated.
1.5 The values stated in inch-pound units are to be regarded as the standard. The SI values are provided for information only.
1.6 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

## 3. Terminology

3.1 Definitions-Definitions are in accordance with Terminologies D883, D1600, and F412, unless otherwise indicated.
3.1.1 coextrusion-a process whereby two or more plastic material streams are forced through one or more shaping orifices and become one continuously formed piece.
3.2 Definitions of Terms Specific to This Standard:
3.2.1 center-layer compound-general description for "internal recycled material" (3.2.5), "external recycled material" (3.2.4), and "post-consumer recycled material" (3.2.6). These materials can be used straight or blended with virgin materials to make a compound, in accordance with this specification.
3.2.2 certificate of composition-a certificate describing certain properties of an external recycled material or a postconsumer recycled material.
3.2.2.1 Discussion-Examples include polymer, molecular weight, percentage of inorganic material, contamination type and level, tensile strength, modulus of elasticity, and izod impact.
3.2.3 composition disclosure-a document describing the formulation of an external recycled material.
3.2.4 external recycled material-industrial rework generated by a different company from the company manufacturing to this specification. Composition is known by the industrial source of the material.
3.2.5 internal recycled material-rework generated by the same company's production that is manufacturing to this specification. Composition of the material is known by the company manufacturing to this specification.
3.2.6 post-consumer recycled material-finished goods that have been purchased by the public, then returned to industry and reprocessed into raw materials. Identity of finished goods is known by the reprocessing company.
3.2.7 thermoplastic coextruded pipe-pipe consisting of two or more concentric thermoplastic layers formed through the process of coextrusion.

## 4. Classification

4.1 The pipes are produced in two diameter families: sewer-drain and IPS.

[^3]4.1.1 Sewer-Drain Series—Produced with a sewer pipe OD and a pipe stiffness of $46 \mathrm{psi}(320 \mathrm{kPa})$. Sewer-drain pipe is intended for use outside of buildings as sewer, sewer connections, underground drain, and storm drain. Wall thicknesses shall be produced so that minimum pipe stiffnesses are met, but shall not be thinner than the minimum wall thickness requirements in Table 1 and Table 2.

Note 1—Base inside diameters will be slightly smaller than those calculated for SDR 35 sewer-drain series pipe when wall thicknesses are increased to ensure minimum 46 pipe stiffness.
4.1.2 IPS Diameter Family—Produced in a Schedule 40 series and a Pipe Stiffness (PS) series.
4.1.2.1 IPS Schedule 40 Series-Produced to Schedule 40 wall thicknesses in accordance with Table 3 and Table 4. Schedule 40 pipe is intended for use as underground drain, DWV (drain, waste, and vent), sewer connections, and other non-pressure uses.
4.1.2.2 IPS Pipe Stiffness Series_Produced to pipe stiffness of $100 \mathrm{psi}(690 \mathrm{kPa})$ or $120 \mathrm{psi}(830 \mathrm{kPa})$. Intended uses include underground communications and electrical distribution. Wall thicknesses shall be produced so that minimum pipe stiffnesses are met, but shall not be thinner than the minimum wall thickness requirements in Table 5 and Table 6.

Note 2-The IPS Pipe Stiffness (PS) series having pipe stiffnesses of $100 \mathrm{psi}(690 \mathrm{kPa})$ and $120 \mathrm{psi}(830 \mathrm{kPa})$ is designed for direct burial (DB). Encasement in concrete is not necessary.
4.1.3 Before installing pipe for industrial waste disposal use, the approval of the code official having jurisdiction should be obtained, as conditions not commonly found in normal use may be encountered.

## 5. Material

5.1 Center-layer Compounds-Center-layer compounds (internal recycled, external recycled, and post-consumer recycled materials) shall be characterized as being PVC-polymer-based. Other PVC-compatible additives (such as lubricants, stabilizers, non-polyvinyl-chloride resin modifiers, pigments, and inorganic fillers) may be present in these materials. The three plastic material types may be used in the percentages specified in 5.1.1, 5.1.2, and 5.1.3, provided that the pipe produced meets all of the requirements of this specification.
5.1.1 Internal Recycled Material-May comprise up to $100 \%$ of the center layer. This material shall not be used in the inner or outer layers.

| 5 | 5.563 | $\pm 0.010$ | 0.100 | 0.179 | 0.191 | 120 |
| 6 | 6.625 | $\pm 0.011$ | 0.100 | 0.213 | 0.227 | 150 |

A "Out of Round" is defined as maximum diameter minus minimum diameter.
${ }^{B}$ The maximum wall thickness shall not be greater than 1.25 times the minimum wall thickness.
${ }^{c}$ Minimum wall-thickness values are based on skin modulus of 400000 psi combined with center-layer modulus of 500000 psi .
${ }^{D}$ This is not an IPS OD, but is a standard-OD pipe-stiffness pipe used by communications utilities.
5.1.2 External Recycled Material-May comprise up to $100 \%$ of the center layer. This material shall not be used in the inner or outer layers.

TABLE 6 SI Requirements for IPS Pipe-Stiffness Pipe

| Nominal Size, in. | Average OD, mm | Tolerance on <br> Average, mm | Out of Round, $\mathrm{mm}^{\text {A }}$ | Minimum Wall Thickness, $\mathrm{mm}^{B, C}$ |  | Impact Resistance J |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 5 | 141.30 | $\pm 0.25$ | 2.54 | 4.55 | 4.85 | 165 |
| 6 | 168.28 | $\pm 0.28$ | 2.54 | 5.41 | 5.77 | 205 |

A "Out of Round" is defined as maximum diameter minus minimum diameter.
${ }^{B}$ The maximum wall thickness shall not be greater than 1.25 times the minimum wall thickness.
${ }^{C}$ Minimum wall-thickness values are based on skin modulus of 400000 psi combined with center-layer modulus of 500000 psi.
${ }^{D}$ This is not an IPS OD, but is a standard-OD pipe-stiffness pipe used by communications utilities.
5.1.3 Post-Consumer Recycled Material-May comprise up to a maximum of $60 \%$ by weight of center layer. This material shall not be used in the inner or outer layers.

Note 3-Post-consumer recycled material is limited to $60 \%$ by weight of the center layer due to current technology. As more experience is gained with process and materials, this standard may be amended to increase the percentage.
5.1.4 When requested by the pipe manufacturer, the supplier shall provide with the external recycled and post-consumer recycled materials a certificate of composition, a composition disclosure, or both.
5.1.5 Virgin PVC homopolymer having an inherent viscosity greater than 0.68 ( $K$-value 57 ) may be blended with center-layer compounds and compounding ingredients (lubricants, stabilizers, non-polyvinyl-chloride resin modifiers, pigments, and inorganic fillers) for use in the center layer. Inherent viscosity shall be determined in accordance with Test Method D1243.
5.2 Inner and outer layers shall be made of virgin homopolymer PVC. Rework materials are not allowed.
5.3 Cell Classification-Properties of the compounds used to manufacture pipe in accordance with this standard shall be categorized using the cell classification method. The required cell values are considered minimums; compounds having higher values than those listed are considered acceptable.
5.3.1 Material for the Sewer-Drain series shall be categorized using Specification D1784. Compound for the inner and outer layers shall have a minimum cell class of 12454 , or 12364 and for the center layer 12223.
5.3.2 Material for the IPS Schedule 40 series shall be categorized using Specification D4396. Compound for the inside and outside layers shall have a minimum cell class of 11432, and for the center layer 11211. Compound for all layers shall meet the chemical-resistance requirement of Specification D4396 with a $130^{\circ} \mathrm{F}\left(55^{\circ} \mathrm{C}\right)$, 14-day immersion.
5.3.3 Material for the IPS Pipe Stiffness (PS) series shall be categorized using Specification D1784. Compound for the inner and outer layers shall have a minimum cell class of 12234, and for the center layer 12223.
5.4 Color-The center layer for all series shall contrast in color with the inner and outer layers such that wall measurements may be taken.
