ISO/CEN PARALLEL PROCESSING

This draft has been developed within the International Organization for Standardization (ISO), and processed under the **ISO-lead** mode of collaboration as defined in the Vienna Agreement.

This draft is hereby submitted to the ISO member bodies and to the CEN member bodies for a parallel five-month enquiry.

Should this draft be accepted, a final draft, established on the basis of comments received, will be submitted to a parallel two-month approval vote in ISO and formal vote in CEN.

To expedite distribution, this document is circulated as received from the committee secretariat. ISO Central Secretariat work of editing and text composition will be undertaken at publication stage.

Pour accélérer la distribution, le présent document est distribué tel qu'il est parvenu du secrétariat du comité. Le travail de rédaction et de composition de texte sera effectué au Secrétariat central de l'ISO au stade de publication.

THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

Amendment 2 to ISO 1302:2002 was prepared by Technical Committee ISO/TC 213, *Dimensional and geometrical product specifications and verification*.

Geometrical Product Specifications (GPS) — Indication of surface texture in technical product documentation

AMENDMENT 2: Indication of material ratio requirements

Page 46, Bibliography

Add the following annexes before the Bibliography:

Annex K (informative)

Indication of material ratio requirements

K.1 Data included in material ratio requirements

A surface texture requirement is constructed from a number of different control elements that may be part of the indication on the drawing or part of text indication in other documents. The elements are shown in K.2 for the material ratio of the *R*- and *W*-profiles and in K.4 for the material ratio of the *P*-profile.

Experience has shown that all these elements are necessary in order to establish an unambiguous relationship between the surface texture requirement and the function of the surface. Most of these features are also necessary in order to set the measuring instrument. Others are necessary in order to obtain an unambiguous evaluation of the result of the measurement and for comparison with the specification limit(s).

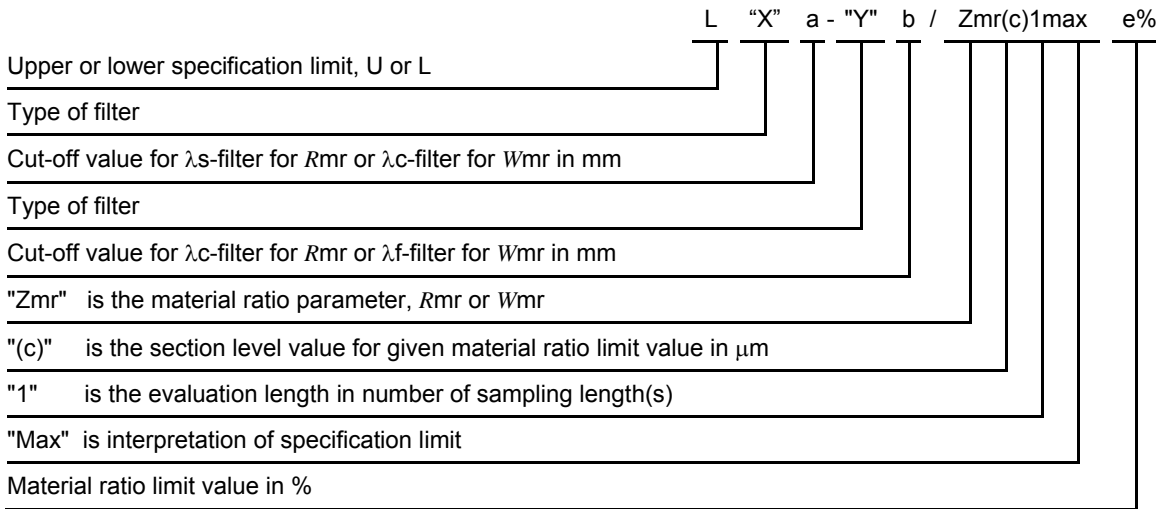

In order to simplify the indication of surface texture requirements and to maintain the unambiguous relationship between drawing indication and the function of the surface, a number of default conditions have been defined. These conditions apply if no indication is made on the drawing. The default conditions result in simpler surface texture indications. However, the principle concerning default definitions has not been completed for all parameters. Standards ISO 3274:1996, ISO 4287:2002, and ISO 4288:1996 contains information on default definitions if such exist.

In those cases when no default definitions exist, complete information on, for example, the interpretation of specification limit(s), transmission band and evaluation length shall be given in the indication of the surface texture requirement on the drawing in order to make the requirement unambiguous and meaningful.

K.2 Indication of material ratio parameters for R- and W-profiles

K.2.1 Indication of material ratio requirement with no reference level for R- and W- profiles

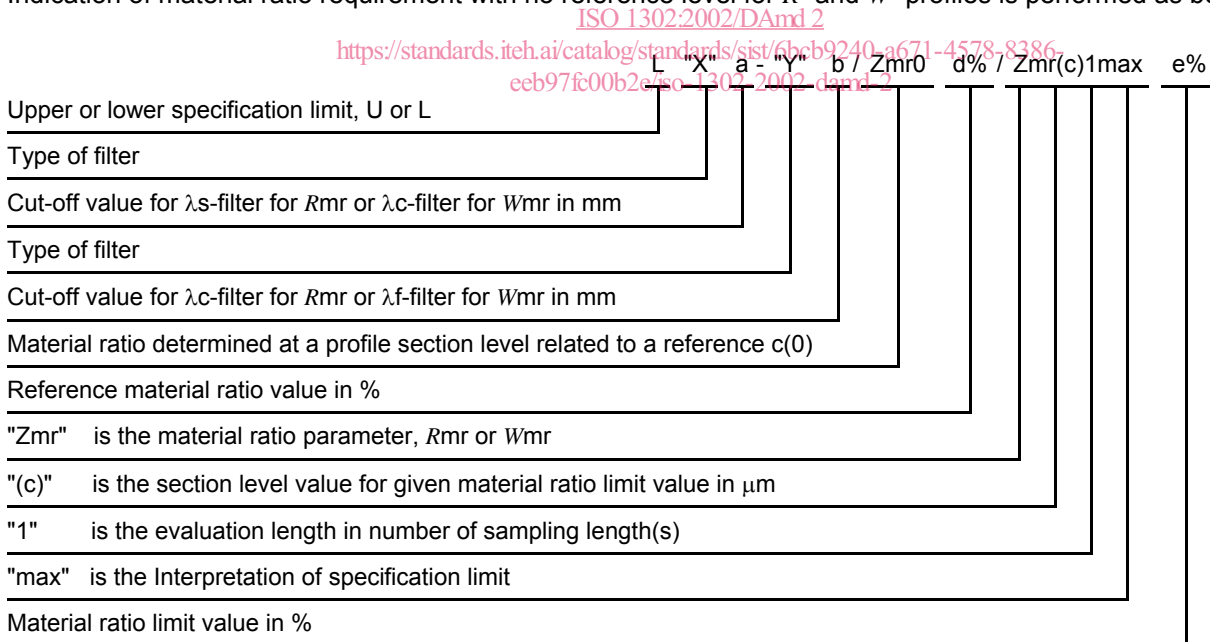

Indication of material ratio requirement with no reference level for R- and W- profiles is performed as below.

iTeh STANDARD PREVIEW

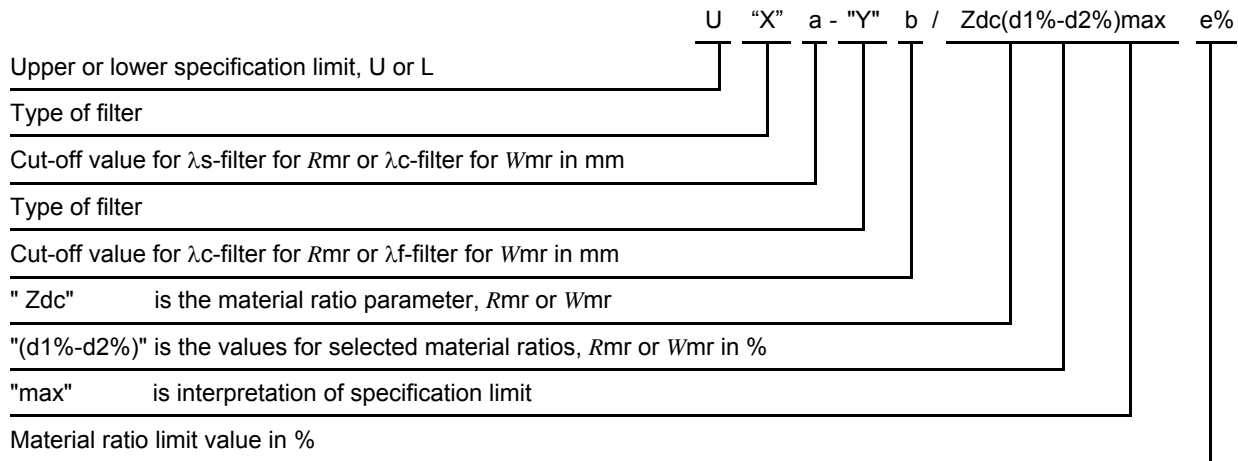

K.2.2 Indication of material ratio requirement with no reference level for R- and W- profiles

Indication of material ratio requirement with no reference level for R- and W- profiles is performed as below.

K.2.3 Indication of material ratio requirement with indication of reference level for R- and W-profiles.

Indication of material ratio requirement with indication of reference level for R- and W- profiles is performed as below.

K.3 Indication rules for R- and W-profiles

Indication of upper or lower specification limit, shall always be used as contrary to other surface texture parameters R_{mr} and W_{mr} are normally specified with their lower limit. For conformance this applies also to the specification of R_{dc} and W_{dc} which are normally specified with their upper limit.

The default filter type is the Gaussian standardized and need not be indicated. Formerly, the 2RC filter was standardized. Other filter types are under standardisation in the standard series ISO 16610. If needed the filter types can be indicated as "Gaussian" or "2RC".

Transmission band is indicated as the values of the cut-offs of a short-wave and a long-wave filter. For R-parameters, there is a default choice of cut-off of long-wave filter and through this also a default choice of cut-off of short-wave filter and thus need not be indicated. For W-parameters, there are no default filters and, for this reason, they shall always be indicated. If R-parameters are also specified, the default is that R-parameter λ_s -filter also applies to the W-profile and thus need not be indicated.

Evaluation length is indicated as a function of the number of sampling lengths where one sampling length equals the numerical value of the cut-off of the long-wave filter. For the R-profile, the default number is 5 and need not be indicated. For the W-profile, the evaluation length shall always be indicated.

For specification limit interpretation either the 16 % rule or the max rule applies. The default is the 16 % rule, which thus need not be indicated. If, on the other hand, the max rule is to apply, this shall be specified as shown in K.4.

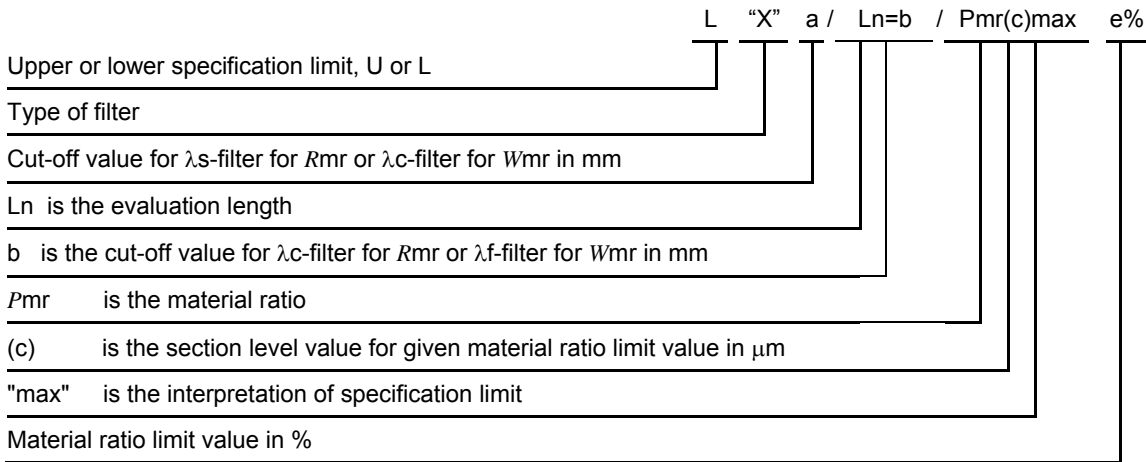

The limit value for material ratio tolerance is expressed in %. This means that the share of material at the given level shall at least correspond to the indicated value in per cent of the evaluation length.

Unless otherwise stated, the reference level shall be specified as a material ratio value in percent at which the reference level R_{mr0} or W_{mr0} is placed. If no reference level is specified, section level c is determined from material ratio 0 % or, expressed in a different way, from the highest peak within the evaluation length. If the mean line is intended as a reference this can be indicated by setting the reference level c to 50%

K.4 Indication of material ratio parameters for P-profiles

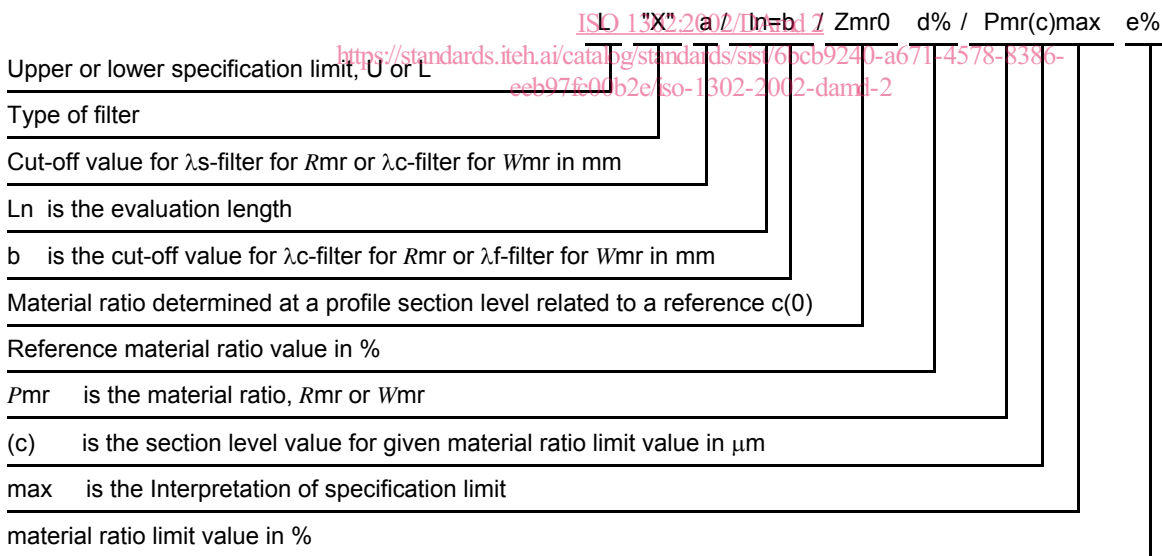

K.4.1 Indication of material ratio requirement with no reference level for P- profiles

Indication of material ratio requirement with no reference level for P- profiles is performed as shown as below.

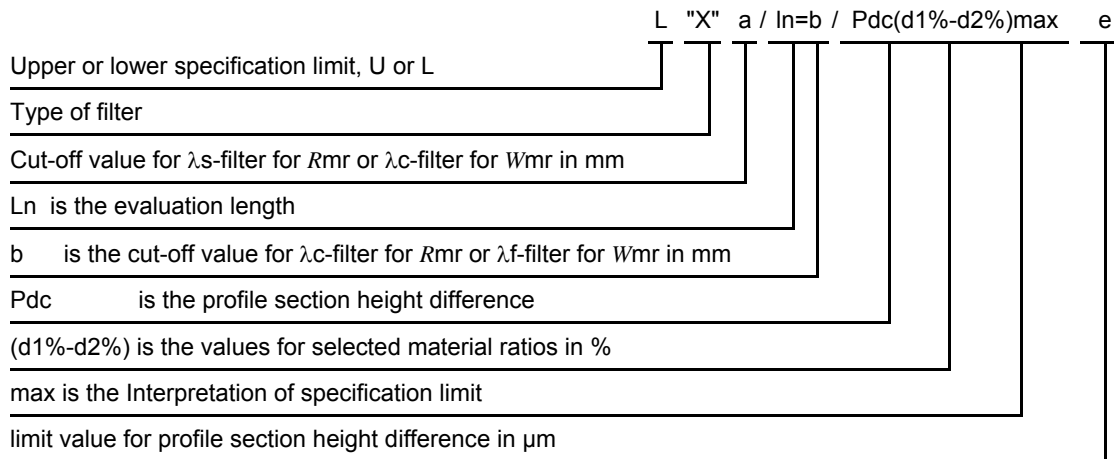

K.4.2 Indication of material ratio requirement with reference level for P- profiles

Indication of material ratio requirement with reference level for P- profiles is performed as below.

K.4.3 Indication of profile section height difference requirement for *P*-profiles

Indication of profile section height difference requirement for *P*-profiles is performed as below.

K.5 Indication rules for *P*-profiles

Indication of upper or lower specification limit, shall always be used as contrary to other surface texture parameters P_{mr} is normally specified with its lower limit. For conformance this applies also to the specification of P_{dc} which is normally specified with its upper limit.

The default s-filter type is the Gaussian standardized and need not be indicated.

<https://standards.iteh.ai/catalog/standards/sist/6bcb9240-a671-4578-8386->

Short-wave filter for the reduction of noise should always be indicated.

NOTE If not indicated the default cut-off is determined by the stylus radius of the instrument used in verification.

If R -parameters are also specified, the default is that R -parameter λ_s -filter also applies to the P -profile and thus need not be indicated. For P -profiles there is no long-wave filter, instead the upper limit is specified as the size of the evaluation length, the maximum of which is the length in the measuring direction of the assessed surface.

Evaluation length is chosen according to the functional intention and shall always be indicated.

For specification limit interpretation either the 16 % rule or the max rule applies. The default is the 16 % rule, which thus need not be indicated. If, on the other hand, the max rule is to apply, this shall be specified as shown in K.4.

The limit value for material ratio tolerance is expressed in %. This means that the share of material at the given level shall at least correspond to the indicated value in per cent of the evaluation length.

Unless otherwise stated, the reference level shall be specified as a material ratio value in percent at which the reference level R_{mr0} or W_{mr0} is placed. If no reference level is specified, section level c is determined from material ratio 0 % or, expressed in a different way, from the highest peak within the evaluation length. If the mean line is intended as a reference this can be indicated by setting the reference level c to 50%
