RECTIFICATIF TECHNIQUE 1

iTeh STANDARD PREVIEW
(standards.iteh.ai)

Technical Corrigendum 1 to ISO/IEC 13818-1:2007 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 29, *Coding of audio, picture, multimedia and hypermedia information* in collaboration with ITU-T. The identical text is published as ITU-T Rec. H.222.0 (2006)/Cor.1 (06/2008).

INTERNATIONAL STANDARD
RECOMMENDATION ITU-TInformation technology – Generic coding of moving pictures
and associated audio information: Systems

Technical Corrigendum 1

Correction of zero_byte syntax element and stream_id_extension mechanism

1) Subclause 2.14.1

Delete the following bullet point and Note:

- Each byte stream NAL Unit that carries the access unit delimiter shall contain exactly one zero_byte syntax element.

NOTE 3 – The syntax and semantics of byte stream NAL units are defined in Annex B of ITU-T Rec. H.264 | ISO/IEC 14496-10.

2) Subclause 2.4.3.6

Change Table 2-21 as indicated below, so as to ensure byte alignment in case the stream_id_extension_flag is '1':

--- Unchanged initial part of Table 2-21 ---		

if (PES_extension_flag_2 == '1') {		
marker_bit	1	bslbf
PES_extension_field_length	7	uimsbf
stream_id_extension_flag	1	bslbf
if (stream_id_extension_flag == '0') {		
stream_id_extension	7	uimsbf
}		
else {		
reserved	7	bslbf
}		
for (i = 1; i < PES_extension_field_length; i++) {		
reserved	8	bslbf
}		
}		

--- Unchanged trailing part of Table 2-21 ---		

3) Subclause 2.5.3.5

Replace Table 2-40 with the following:

Table 2-40 – Program Stream system header

Syntax	No. of bits	Mnemonic
system_header () {		
system_header_start_code	32	bslbf
header_length	16	uimsbf
marker_bit	1	bslbf
rate_bound	22	uimsbf
marker_bit	1	bslbf
audio_bound	6	uimsbf
fixed_flag	1	bslbf
CSPS_flag	1	bslbf
system_audio_lock_flag	1	bslbf
system_video_lock_flag	1	bslbf
marker_bit	1	bslbf
video_bound	5	uimsbf
packet_rate_restriction_flag	1	bslbf
reserved_bits	7	bslbf
while (nextbits () == '1') {		
stream_id	8	uimsbf
if (stream_id == '1011 0111') {		
'11'	2	bslbf
'000 0000'	7	bslbf
stream_id_extension	7	uimsbf
'1011 0110'	8	bslbf
'11'	2	bslbf
P-STD_buffer_bound_scale	1	bslbf
P-STD_buffer_size_bound	13	uimsbf
} else {		
'11'	2	bslbf
P-STD_buffer_bound_scale	1	bslbf
P-STD_buffer_size_bound	13	uimsbf
}		
}		
}		

4) Subclause 2.5.3.6

Change the following paragraphs:

stream_id – The stream_id is an 8-bit field that indicates the coding and elementary stream number of the stream to which the following P-STD_buffer_bound_scale and P-STD_buffer_size_bound fields refer.

If stream_id equals '1011 1000' the P-STD_buffer_bound_scale and P-STD_buffer_size_bound fields following the stream_id refer to all audio streams in the Program Stream.

If stream_id equals '1011 1001' the P-STD_buffer_bound_scale and P-STD_buffer_size_bound fields following the stream_id refer to all video streams in the Program Stream.

If stream_id equals '1111 1101', the P-STD_buffer_bound_scale and P-STD_buffer_size_bound fields following the stream_id refer to all elementary streams with an extended_stream_id in the Program Stream, independent of the coded value of the stream_id_extension in the PES header of those streams.

If stream_id equals '1011 0111', the following stream_id_extension field shall be interpreted as referring to the stream coding and elementary stream number according to Table 2-27.

If the stream_id takes on any other value it shall be a byte value greater than or equal to '1011 1100' and shall be interpreted as referring to the stream coding and elementary stream number according to Table 2-22.

Each elementary stream present in the Program Stream shall have its P-STD_buffer_bound_scale and P-STD_buffer_size_bound specified exactly once by this mechanism in each system header.

stream_id_extension – The stream_id_extension is a 7-bit field. In case the stream_id field is coded with the value '1011 0111', then the stream_id_extension indicates the coding and elementary stream number of the stream with an extended_stream_id to which the P-STD_buffer_bound_scale and P-STD_buffer_size_bound fields following the stream_id_extension field refer.

5) Subclause 2.5.4.1

Replace Table 2-41 with the following:

Table 2-41 – Program Stream map

Syntax	No. of bits	Mnemonic
program_stream_map() {		
packet_start_code_prefix	24	bslbf
map_stream_id	8	uimsbf
program_stream_map_length	16	uimsbf
current_next_indicator	1	bslbf
single_extension_stream_flag	1	bslbf
reserved	1	bslbf
program_stream_map_version	5	uimsbf
reserved	7	bslbf
marker_bit	1	bslbf
program_stream_info_length	16	uimsbf
for (i = 0; i < N; i++) {		
descriptor()		
}		
elementary_stream_map_length	16	uimsbf
for (i = 0; i < N1; i++) {		
stream_type	8	uimsbf
elementary_stream_id	8	uimsbf
elementary_stream_info_length	16	uimsbf
if (elementary_stream_id == 0xFD &&		
single_extension_stream_flag == 0) {		
pseudo_descriptor_tag	8	uimsbf
pseudo_descriptor_length	8	uimsbf
marker_bit	1	bslbf
elementary_stream_id_extension	7	uimsbf
for (i = 3; i < N2; i++) {		
descriptor()		
}		
}		
} else {		
for (i = 0; i < N2; i++) {		
descriptor()		
}		
}		
CRC_32	32	rpchof
}		

6) Subclause 2.5.4.2

a) Add the following paragraph between current_next_indicator and program_stream_map_version:

single_extension_stream_flag – This is a 1-bit field indicating, when set to '1', that the program stream contains at most one elementary stream with stream_id equal to 0xFD.

b) Replace the following paragraphs:

elementary_stream_id – The elementary_stream_id is an 8-bit field indicating the value of the stream_id field in the PES packet headers of PES packets in which this elementary stream is stored.

elementary_stream_info_length – The elementary_stream_info_length is a 16-bit field indicating the length in bytes of the descriptors immediately following this field.

with:

elementary_stream_id – The elementary_stream_id is an 8-bit field indicating the value of the stream_id field in the PES packet headers of PES packets in which this elementary stream is stored. When elementary_stream_id is equal to 0xFD, the following applies:

- If single_extension_stream_flag is equal to 1, this indicates that the program stream contains only one elementary stream with stream_id equal to 0xFD. Note that the type of this elementary stream is signalled by the encoded value of the stream_id_extension field in the PES headers of PES packets carrying this elementary stream.
- Otherwise (single_extension_stream_flag is equal to 0), the elementary_stream_id_extension field is present to identify the elementary stream.

elementary_stream_info_length – The elementary_stream_info_length is a 16-bit field indicating the length in bytes of the descriptors and, when present, the pseudo_descriptor_tag, the pseudo_descriptor_length, and the elementary_stream_id_extension (and associated marker_bit) data immediately following this field.

pseudo_descriptor_tag – This is an 8-bit unsigned integer that shall be coded with the value 0x01; note that the use of value 0x01 for descriptor tags is forbidden in Table 2-45.

pseudo_descriptor_length – The pseudo_descriptor_length is an 8-bit unsigned integer that shall be coded with the value 1.

elementary_stream_id_extension – This 7-bit field, when present, indicates the encoded value of the elementary_stream_id_extension field in the PES packet headers of PES packets in which this elementary stream is stored.

7) Subclause 2.5.5.1

Replace Table 2-42 with the following:

Table 2-42 – Program Stream directory packet

Syntax	No. of bits	Mnemonic
directory_PES_packet(){		
packet_start_code_prefix	24	bslbf
directory_stream_id	8	uimsbf
PES_packet_length	16	uimsbf
number_of_access_units	15	uimsbf
marker_bit	1	bslbf
prev_directory_offset[44..30]	15	uimsbf
marker_bit	1	bslbf
prev_directory_offset[29..15]	15	uimsbf
marker_bit	1	bslbf
prev_directory_offset[14..0]	15	uimsbf
marker_bit	1	bslbf
next_directory_offset[44..30]	15	uimsbf
marker_bit	1	bslbf
next_directory_offset[29..15]	15	uimsbf
marker_bit	1	bslbf
next_directory_offset[14..0]	15	uimsbf
marker_bit	1	bslbf
for (i = 0; i < number_of_access_units; i++) {		
packet_stream_id	8	uimsbf
PES_header_position_offset_sign	1	tcimsbf
PES_header_position_offset[43..30]	14	uimsbf
marker_bit	1	bslbf
PES_header_position_offset[29..15]	15	uimsbf
marker_bit	1	bslbf
PES_header_position_offset[14..0]	15	uimsbf
marker_bit	1	bslbf
reference_offset	16	uimsbf
marker_bit	1	bslbf
if (packet_stream_id == 0xFD) {		
packet_stream_id_extension_msbs	3	uimsbf
} else {		
reserved	3	bslbf
PTS[32..30]	3	uimsbf
marker_bit	1	bslbf
PTS[29..15]	15	uimsbf
marker_bit	1	bslbf
PTS[14..0]	15	uimsbf
marker_bit	1	bslbf
bytes_to_read[22..8]	15	uimsbf
marker_bit	1	bslbf
bytes_to_read[7..0]	8	uimsbf
marker_bit	1	bslbf
intra_coded_indicator	1	bslbf
coding_parameters_indicator	2	bslbf
if (packet_stream_id == 0xFD) {		
packet_stream_id_extension_lsbs	4	uimsbf
} else {		
reserved	4	bslbf
}		
}		
}		

8) Subclause 2.5.5.2

In subclause 2.5.5.2, insert the following paragraphs at the end of the subclause:

packet_stream_id_extension_msbs – This 3-bit field is present if packet_stream_id equals 0xFD; its coding is specified below.

packet_stream_id_extension_lsbs – This 4-bit field is present if packet_stream_id equals 0xFD; its coding is specified below.

If packet_stream_id is equal to 0xFD, the packet_stream_id_extension indicates the encoded value of the stream_id_extension in the PES header of the PES packet(s) containing the access unit referenced by this directory entry. The value of the packet_stream_id_extension is specified by:

$$\text{packet_stream_id_extension} = \text{packet_stream_id_extension_msbs} * 16 + \text{packet_stream_id_extension_lsbs}$$

9) Subclause 2.6.1

Change descriptor tag 1 from "reserved" into "forbidden" by replacing Table 2-45 by:

Table 2-45 – Program and program element descriptors

descriptor_tag	TS	PS	identification
0	n/a	n/a	reserved
