

# Standard Test Method for Purity of Aldehydes and Ketones<sup>1</sup>

This standard is issued under the fixed designation D2192; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon  $(\varepsilon)$  indicates an editorial change since the last revision or reapproval.

# 1. Scope\*

- 1.1 This test method covers the determination of the purity of certain commercially available aldehydes and ketones.
- 1.2 In addition to all aldehydes and ketones, all compounds such as vinyl alkyl ethers, acetals, and ketals, that hydrolyze under the conditions of the reaction to form free carbonyl groups, react with the reagent and consequently interfere. Water, alcohols, saturated esters, and hydrocarbons do not react with the reagent, but large amounts of inert organic solvents are undesirable because of the effect on the indicator.
- 1.3 For purposes of determining conformance of an observed or a calculated value using this test method to relevant specifications, test result(s) shall be rounded off "to the nearest unit" in the last right-hand digit used in expressing the specification limit, in accordance with the rounding-off method of Practice E29.
- 1.4 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.
- 1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. For specific hazard statements, see Section 7.
- 1.6 For hazard information and guidance, see the supplier's Material Safety Data Sheet.

E200 Practice for Preparation, Standardization, and Storage of Standard and Reagent Solutions for Chemical Analysis
 E222 Test Methods for Hydroxyl Groups Using Acetic Anhydride Acetylation

# 3. Summary of Test Method

3.1 Hydroxylamine hydrochloride is converted in part to free hydroxylamine by reaction with a known amount of aqueous triethanolamine.

$$NH_2$$
OH·HCl+ $(HOCH_2CH_2)_3N \rightarrow$  (1)  
 $NH_2OH+(HOCH_2CH_2)_3$ N·HCl

The free hydroxylamine reacts with the aldehyde or ketone to form the corresponding oxime.

$$RR_1C = 0 + NH_2OH \rightarrow RR_1C = H = NOH + H_2O, \qquad (2)$$

where:

R = alkyl group and

R, = alkyl group or hydrogen.

The amount of hydroxylamine consumed, which is determined by titration of the excess base with standard sulfuric acid, is a measure of the aldehyde or ketone originally present.

3.2 Since the determination is based on an acidimetric titration, a suitable correction must be applied if the sample is not neutral to bromophenol blue indicator.

#### 4. Significance and Use

- 4.1 This test method provides a measurement of purity (assay) of aldehydes and ketones. The results of these measurements can be used for specification acceptance.
- 4.2 The precision of this test method is applicable only to material having a purity of 98 to 100 %.

## 5. Apparatus

- 5.1 *Pressure Bottle*, 200 to 350-mL capacity, with lever type closure and made of heat-resistant glass.
- 5.2 Container for Pressure Bottle— A suitable safety device to contain the pressure bottle. A metal container with a hinged

<sup>&</sup>lt;sup>1</sup> This test method is under the jurisdiction of ASTM Committee D01 on Paint and Related Coatings, Materials, and Applications and is the direct responsibility of Subcommittee D01.35 on Solvents, Plasticizers, and Chemical Intermediates.

Current edition approved June 1, 2006. Published June 2006. Originally approved in 1963. Last previous edition approved in 2000 as D2192 - 96 (2000). DOI: 10.1520/D2192-06.

top and perforated bottom, a strong synthetic fabric or canvas bag, or a safety shield may be used.

- 5.3 Ampoule, 1 or 2-mL capacity.
- 5.4 Weighing Pipet, Lunge or similar type.
- 5.5 Burets, 50-mL capacity.
- 5.6 Transfer Pipet, 50-mL capacity.
- 5.7 Glass Rod, 8-mm, several pieces approximately 1 in. long.
  - 5.8 Boiling Water Bath.

## 6. Reagents and Materials

- 6.1 Purity of Reagents—Reagent grade chemicals shall be used in all tests. Unless otherwise indicated, it is intended that all reagents shall conform to the specifications of the Committee on Analytical Reagents of the American Chemical Society, where such specifications are available.<sup>3</sup> Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lessening the accuracy of the determination.
- 6.2 *Purity of Water*—Unless otherwise indicated, references to water shall be understood to mean reagent water conforming to Type IV of Specification D1193.
- 6.3 Bromophenol Blue Indicator (0.04 % Alcoholic Solution)—Dissolve 0.04 g of bromophenol blue (tetrabromophenolsulfonphthalein) in 100 mL of methyl alcohol. Titrate this solution with 0.1 N sodium hydroxide (NaOH) solution to a reddish-bronze color. If an off-color is obtained at this point, it is probably due to the age of the indicator and fresh indicator should be used to prepare a new solution.
  - 6.4 Cylinder Nitrogen.
- 6.5 Hydroxylamine Hydrochloride, Standard (0.5 N Alcoholic Solution)—Dissolve 35 g of hydroxylamine hydrochloride (NH<sub>2</sub>OH  $\cdot$  HCl) in 150 mL of water and dilute to 1 L with 99 % isopropanol.
  - 6.6 *Isopropanol* (99 %).
- 6.7 Sulfuric Acid, Standard (0.5 N)—Prepare and standardize 0.5 N sulfuric acid ( $H_2SO_4$ ) in accordance with Practice E200, sections on Precision and Bias, Standardization with Tris(hydroxymethyl)-Aminomethane, Calculation, and Stability.
- 6.8 Triethanolamine, Standard (0.5 N Aqueous Solution)—Dissolve 65 mL (74 g) of 98 % triethanolamine in water and dilute to 1 L with water. Adjust the normality of this solution so that it is slightly below the normality of the  $\rm H_2SO_4$  being used.

#### 7. Procedure

7.1 Sample the material in accordance with Guide D268.

- 7.2 Add 15 mL of a 0.04 % alcoholic solution of bromophenol blue indicator to 500 mL of the hydroxylamine hydrochloride solution. From a buret add 0.5 N triethanolamine until the solution appears greenish-blue by transmitted light. Prepare the solution fresh before each series of analyses.
- 7.3 Prepare a sufficient number of heat-resistant pressure bottles to make all blank and sample determinations in duplicate. Replace the rubber gaskets if necessary and make sure the caps can be fastened securely.
- 7.4 Using a graduated cylinder, add 65 mL of the neutralized hydroxylamine hydrochloride to each bottle. Using a transfer pipet, add 50.0 mL of the 0.5 *N* triethanolamine solution to each bottle.
- 7.5 Before capping, purge the bottles for 2 min with a gentle stream of cylinder nitrogen. This is best accomplished by means of a glass tube inserted through the neck of the bottle and clamped so that the opening is just above the surface of the liquid.
- 7.6 Reserve two of the bottles for the blank determination. Into each of the other bottles introduce an amount of sample containing not more than 0.015 mol of aldehyde or ketone. For substantially pure material, weigh the specimen to the nearest 0.1 mg, using the amount and procedure specified in Table 1.
- 7.6.1 **Warning:** Acetaldehyde is a highly volatile, flammable material; observe all necessary safety precautions. Handle samples only in a fume hood that is free from open flames, electric heaters, and other sources of ignition. Cool all samples in an ice bath before the containers are opened. Weigh the acetaldehyde in a sealed glass ampoule. The actual procedure for filling and sealing the ampoule will vary somewhat with the type of ampoule being used. One convenient method is to pack commercially available ampoules in powdered, solid carbon dioxide, introduce the specimen by means of a chilled hypodermic syringe, and seal the ampoule with a gas torch.
- 7.7 If a sealed glass ampoule is used to weigh the specimen, add several pieces of 8-mm glass rod and shake the bottle vigorously to break the ampoule.
- 7.8 React the solutions at room temperature or at 98°C according to the directions in Table 1.
- 7.8.1 Reaction at 98°C (Warning—See 7.8.1.1.)—Place the specimen and blank bottles as close together as possible in a boiling water bath maintained at least at 98°C for the time specified in Table 1. Maintain sufficient water in the bath to just cover the liquid in the bottles. Remove the bottles from the bath after the specified time and allow them to cool in air to

**TABLE 1 Specimen Size and Reaction Conditions** 

Compound	Specimen, $g^A$	Minimum Reaction Conditions	
		Time, min	Tempera- ture,° C
Acetaldehyde (7.6.1)	0.5 to 0.7 <sup>B</sup>	30	25
Methyl isobutyl ketone	1.1 to 1.4 <sup>B</sup>	60	25
Methyl isoamyl ketone	1.1 to 1.7	30	25
Isophorone	1.4 to 2.0	60	98

<sup>&</sup>lt;sup>A</sup> Use a suitable weighing pipet unless otherwise specified.

<sup>&</sup>lt;sup>3</sup> Reagent Chemicals, American Chemical Society Specifications , American Chemical Society, Washington, DC. For suggestions on the testing of reagents not listed by the American Chemical Society, see Analar Standards for Laboratory Chemicals, BDH Ltd., Poole, Dorset, U.K., and the United States Pharmacopeia and National Formulary, U.S. Pharmacopeial Convention, Inc. (USPC), Rockville, MD.

<sup>&</sup>lt;sup>B</sup> Use a sealed glass ampoule.
