# Intellectual Property Rights

#### **Essential patents**

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

#### **Trademarks**

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

#### **Foreword**

This final draft ETSI Standard (ES) has been produced by ETSI Technical Committee Speech and multimedia Transmission Quality (STQ), and is now submitted for the ETSI standards Membership Approval Procedure.

# Modal verbs terminology

In the present document "shall", "shall not", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

#### Introduction

Traditionally, the analogue and digital telephones were interfacing switched-circuit 64 kbit/s PCM networks. With the fast growth of IP networks, packet-switched networks (VoIP) interfacing PSTN networks and mobile networks, as well as different types of IP-terminals, are being rapidly introduced. Different types of gateways are used to interconnect to such IP networks. Since the IP networks will be in many cases interworking with the traditional PSTN and private networks, many of the basic transmission requirements have to be harmonized between these different types of network from an end-to-end perspective, including specifications for the edge points.

The present document covers IP-based narrowband and wideband home and network media gateways. It aims to enhance the interoperability and end-to-end quality.

In contrast to other standards which define minimum performance requirements, it is the intention of the present document to specify gateway equipment requirements which enable manufacturers and service providers to enable end-to-end speech performance as perceived by the user. These requirements are absolutely necessary to ensure a good quality, but they are not sufficient. They have to be combined with requirements (and associated relevant measurement methods) for other elements in the transmission chain (core IP network, PSTN, terminals), as well as for the whole mouth-to-ear transmission path.

## 1 Scope

The present document provides speech transmission performance requirements for narrowband and wideband media gateways from a QoS perspective as perceived by the user. Media gateways can be network or home based, they may include a transcoding function. The present document covers the following types of IP-based media gateways:

- ATA (Analogue Terminal Adapter), home gateway IP to POTS
- ITA (ISDN Terminal Adapter), home gateway IP to ISDN
- IAD (Integrated Access device), home router including ATA or ITA
- Network based ATA and ITA
- Carrier grade media gateway, network gateway IP to TDM
- IP-to-IP media gateway, network gateway with transcoding and/or other media processing
- New Generation DECT Fixed part with IP interface (only parameters not covered by New Generation DECT)

Interfaces of media gateways used together with terminals as a system (i.e. connected via Ethernet or with a proprietary interface) are excluded in the present document and should be measured according to the relevant terminal standard.

If a media gateway includes more than one interface type (e.g. POTS and ISDN), each interface has to be dealt with differently.

The requirements available in the present document will ensure a high compatibility with IP-and TDM-based fixed and wireless terminals and networks, including DECT and mobile terminals.

It is the aim to optimize interoperability, the listening and talking quality and the conversational performance. Related requirements and test methods are defined in the present document.

The present document does not apply to media gateways with 4-wire analogue interfaces.

The requirements for MGWs with respect to voiceband data (VBD) are out of scope in the present document. These requirements are covered in ETSI TS 102 929 [i.5].

# 2 References

#### 2.1 Normative references

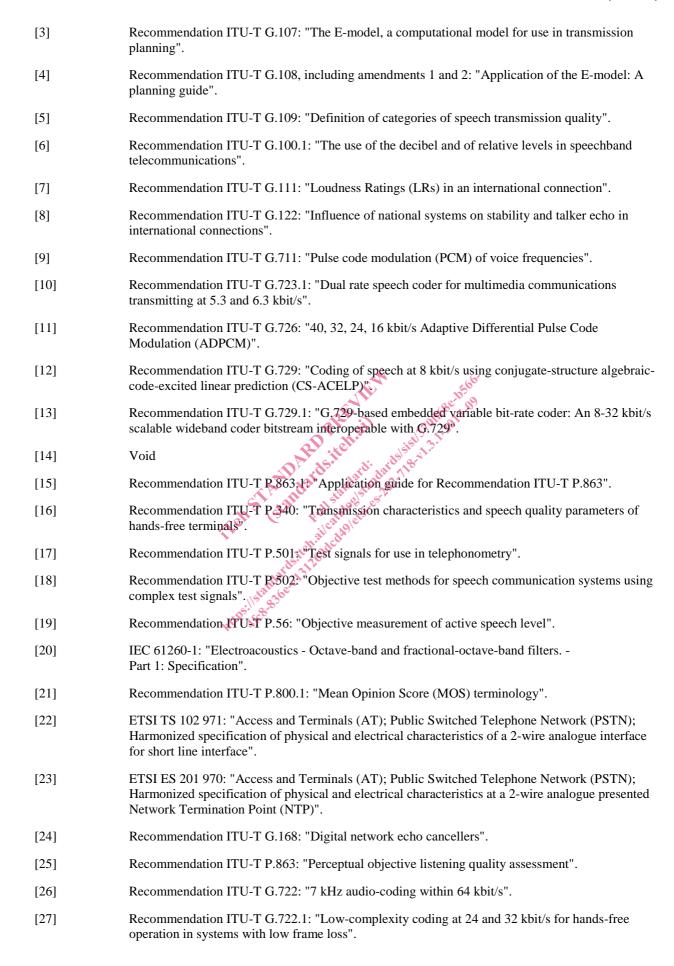

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <a href="https://docbox.etsi.org/Reference/">https://docbox.etsi.org/Reference/</a>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

- [1] ETSI EN 300 726: "Digital cellular telecommunications system (Phase 2+) (GSM); Enhanced Full Rate (EFR) speech transcoding (GSM 06.60)".
- [2] ETSI TS 126 171: "Digital cellular telecommunications system (Phase 2+); Universal Mobile Telecommunications System (UMTS); AMR speech codec, wideband; General description (3GPP TS 26.171 version 6.0.0 Release 6)".

### 3 Definitions and abbreviations

#### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

**0dBr point:** reference point always located at the digital side of the gateway, for IP-IP gateways located at the input of the MGW under test

NOTE: See Recommendation ITU-T G.100.1 [6].

**2-wire interface:** in the context of the present document, telephony analogue interface over 2-wires used in the local loop

**4-wire interface:** in the context of the present document, 4-wire digital interface with separate channels for both directions, irrespective of the physical transmission technology

**codec:** combination of an analogue-to-digital encoder and a digital-to-analogue decoder operating in opposite directions of transmission in the same equipment

Composite Source Signal (CSS): signal composed in time by various signal elements

MGW with 2-wire interface: MGW with an analogue 2-wire interface (ATA)

MGW with 4-wire interface: MGW with only 4-wire interfaces

EXAMPLE: ITA, IP-to-IP and wireless access points.

**receive direction:** direction from packet switched interfaces towards a synchronous interface (e.g. ISDN, analogue) or between two packet switched interfaces (for media gateways with packet switched transport on only one side)

NOTE: For media gateways with packet switched transport on both sides (IP-to-IP-MGW), the requirements of the receive direction have to be applied in both directions.

receive interface: interface in the measurement setup, where a receive signal is injected and/or a send signal is measured

**send direction:** direction from a synchronous interface (e.g. ISDN, analogue) towards a packet switched interface (for media gateways with packet switched interface on only one side)

NOTE: For media gateways with packet switched interfaces on both sides the requirements of the send direction are not relevant.

send interface: interface in the measurement setup, where a send signal is injected and/or a receive signal is measured

wireless home MGW: home MGW with wireless interface to the phone

EXAMPLE: Wifi or DECT.

# 4 General considerations

#### 4.1 Default Coding Algorithm

Narrowband VoIP gateways shall support the coding algorithm according to Recommendation ITU-T G.711 [9] (both  $\mu$ -law and A-law). VoIP gateways may support other coding algorithms.

Wideband VoIP gateways shall support the coding algorithm according to Recommendation ITU-T G.722 [26]. VoIP gateways may support other coding algorithms.

NOTE: Associated Packet Loss Concealment (PLC) e.g. as defined in Recommendation ITU-T G.711 [9] appendix I should be used.

#### 4.2 End-to-end considerations

In order to achieve a desired end-to-end speech transmission performance (mouth-to-ear) it is recommended that the general rules of transmission planning are carried out with the E-model of Recommendation ITU-T G.107 [3]; this includes the a-priori determination of the desired category of speech transmission quality as defined in Recommendation ITU-T G.109 [5].

While, in general, the transmission characteristics of single circuit-oriented network elements, such as switches or terminals can be assumed to have a single input value for the planning tasks of Recommendation ITU-T G.108 [4] with its amendments, this approach is not applicable in packet based systems and thus there is a need for the transmission planner's specific attention.

In particular the decision as to which delay measured according to the present document is acceptable or representative for the specific configuration is the responsibility of the individual transmission planner.

Recommendation ITU-T G.108 [4] with its amendments provides further guidance on this important issue.

The following optimum parameters from a users' perspective need to be considered:

- Minimized delay in send and receive direction.
- Optimum Circuit Loudness Rating (CLR).
- Compensation for network delay variation.
- Packet loss recovery performance.
- Maximized echo loss.
- Immunity to false detection of DTMF in speech signal.

# 4.3 Parameters to be investigated

#### 4.3.1 Applicability of parameters to different MGWs

**Table 1: Parameter applicability** 

|   | 2-wire home                              | 4-wire MGW   | 4-wire MGW     | wireless home |

M: Mandatory

MM: Mandatory for both interfaces of the MGW

NA: Not applicable FFS: For further study

NOTE 1: Measurement to be done with different echopaths (see clause 6.1.7).

NOTE 2: Measurement to be done with Ref PP settings "34/42dB TCLw" only. Echopath set accordingly (see

clause 6.1.7).

NOTE 3: Measurement mandatory, if PP does not support PLC.

# 5 Test equipment

# 5.1 IP half channel measurement adaptor

The IP half channel measurement adaptor is described in ETSI EG 202 425 [i.1]. Such an apparatus is required to code and insert audio signals into IP packets send to the IP receive interface of the gateway under test, as well as to capture and decode audio signals constituting the payload of IP packets received from the IP sending interface of the gateway under test.

#### 5.2 Environmental conditions for tests

The following conditions shall apply for the testing environment:

a) Ambient temperature: 15 °C to 35 °C (inclusive);

b) Relative humidity: 5 % to 85 %;

c) Air pressure: 86 kPa to 106 kPa (860 mbar to 1 060 mbar).

### 5.3 Accuracy of measurements and test signal generation

Unless specified otherwise, the accuracy of measurements made by test equipment shall be equal to or better than:

**Table 2: Measurement Accuracy** 

| Item                    | Accuracy                               |
|-------------------------|--|
| Electrical signal level | ±0,2 dB for levels ≥ -50 dBV           |
| Frequency               | ±0,4 dB for levels < -50 dBV<br>±0.2 % |
| Time                    | ±0,2 %                                 |

Unless specified otherwise, the accuracy of the signals generated by the test equipment shall be better than:

**Table 3: Accuracy of test signal generation** 

| Quantity   | Accuracy                                 |  |
|--|--|--|
| Electrical excitation levels   | ±0,4 dB across the whole frequency range |  |
| Frequency generation   | ±2 % (see note)                          |  |
| Time   | ±0,2 %                                   |  |
| Specified component values   | ±1 %                                     |  |
| NOTE: This tolerance may be used to avoid measurements at critical frequencies, e.g. those |  |  |
| due to sampling operations within the terminal under test.                                 |  |  |

If the equipment is powered by other means and those means are not supplied as part of the apparatus, all tests shall be carried out within the power supply limit declared by the supplier. If the power supply is a.c. the test shall be conducted within  $\pm 4$  % of the rated frequency.

# 5.4 Network impairment simulation

At least one set of requirements is based on the assumption of an error free packet network, and at least one other set of requirements is based on a defined simulated malperformance of the packet network.

An appropriate network simulator has to be used, for example Netem<sup>TM</sup>.

The key points of Netem<sup>TM</sup> can be summarized as follows:

- Netem<sup>TM</sup> is part of most Linux<sup>TM</sup> distributions, it only has to be switched on, when compiling a kernel. With Netem<sup>TM</sup>, there are the same possibilities as with Nistnet<sup>TM</sup>, there can be generated loss, duplication, delay and jitter (and the distribution can be chosen during runtime). Netem<sup>TM</sup> can be run on a Linux<sup>TM</sup>-PC running as a bridge or a router (Nistnet<sup>TM</sup> only runs on routers).
- With an amendment of Netem<sup>TM</sup>, TCN (Trace Control for Netem<sup>TM</sup>) which was developed by ETH Zurich<sup>TM</sup>, it is even possible, to control the behaviour of single packets via a trace file. So it is for example possible to generate a single packet loss, or a specific delay pattern. This amendment is planned to be included in new Linux<sup>TM</sup> Kernels, nowadays it is available as a patch to a specific kernel and to the iproute2 tool (iproute2 contains Netem<sup>TM</sup>).
- It is not advised to define specific distortion patterns for testing in standards, because it will be easy to adapt devices to these patterns (as it is already done for test signals). But if a pattern is unknown to a manufacturer, the same pattern can be used by a test lab for different devices and gives comparable results. It is also possible to take a trace of Nistnet<sup>TM</sup> distortions, generate a file out of this and playback the exact same distortions with Netem<sup>TM</sup>.

NOTE: Nistnet<sup>TM</sup> and Netem<sup>TM</sup> are examples of suitable products available commercially. This information is given for the convenience of users of the present document and does not constitute an endorsement by ETSI of these products.
