## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 12643-1 was prepared by Technical Committee ISO/TC 130, *Graphic technology*.

This first edition of ISO 12643-1, together with ISO 12643-2, cancels and replaces ISO 12648:2006, which has been technically revised. This edition of ISO 12643-1, together with ISO 12643-3, cancels and replaces ISO 12649:2004, which has been technically revised.

ISO 12643 consists of the following parts, under the general title *Graphic technology — Safety requirements for graphic technology equipment and systems*:

- Part 1: General requirements
- Part 2: Press equipment and systems
- Part 3: Binding and finishing equipment

## Introduction

During the development of this part of ISO 12643, existing relevant standards of other countries were taken into consideration. An effort has been made to take into consideration the requirements of many countries, recognizing that national standards or laws may dictate national requirements. In cases where it was known that there is a national requirement that differs from this part of ISO 12643, that has been noted.

This part of ISO 12643 was developed to harmonize the following U.S. and European safety standards:

- ANSI B65.1, *Graphic technology — Safety standard — Printing press systems*;
- ANSI B65.2, *Binding and Finishing Systems*;
- ANSI B65.3, *Safety standard — Guillotine paper cutters, mill trimmers, and integral handling equipment*;
- ANSI B65.4, *Safety standard — Three-knife trimmers, including rotary, and single- and multiple-knife trimmers*;
- EN 1010-1, *Safety of machinery — Safety requirements for the design and construction of printing and paper converting machines — Part 1: Common requirements*;
- EN 1010-2, *Safety of machinery — Safety requirements for the design and construction of printing and paper converting machines — Part 2: Printing and varnishing machines including pre-press machinery*;
- EN 1010-3, *Safety of machinery — Safety requirements for the design and construction of printing and paper converting machines — Part 3: Cutting machines*;
- EN 1010-4, *Safety of machinery — Safety requirements for the design and construction of printing and paper converting machines — Part 4: Bookbinding, paper converting and finishing machines*.

SIST ISO 12643-1:2008

<https://standards.iteh.ai/catalog/standards/sist/99396a04-86f9-41c2-8f61-3b8068523c00/sist-iso-12643-1-2008>

# Graphic technology — Safety requirements for graphic technology equipment and systems —

## Part 1: General requirements

### 1 Scope

This part of ISO 12643 provides safety specifications for the design and construction of new machines used in printing press systems and in binding and finishing systems. It includes equipment used in a stand-alone mode, or in combination with other machines, including ancillary equipment, in which all the machine actuators (e.g. drives) of the equipment are controlled by the same control system.

The requirements listed in this part of ISO 12643 are applicable to the equipment covered by all parts of ISO 12643, unless otherwise noted. Requirements specific to press and binding and finishing equipment and systems, that are not included in this part of ISO 12643, are given in ISO 12643-2 and ISO 12643-3, respectively.

This part of ISO 12643 addresses recognized hazards specific to equipment and systems in the following areas:

- [SIST ISO 12643-1:2008](https://standards.iteh.ai/catalog/standards/sist/99396a04-86f9-41c2-8f61-3b8068523c00/sist-iso-12643-1-2008)  
<https://standards.iteh.ai/catalog/standards/sist/99396a04-86f9-41c2-8f61-3b8068523c00/sist-iso-12643-1-2008>
- mechanical;
  - electrical;
  - slipping, tripping, falling;
  - ergonomics;
  - noise;
  - radiation;
  - fire and explosion;
  - thermal;
  - other emissions.

It is advisable that technologies not identified in this part of ISO 12643 incorporate the safety principles set forth herein in their design.

## 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 13849-1:1999 and the following apply.

#### 3.1 actuator

part of the actuating system to which an external actuating force is applied

[IEV 441-15-22]<sup>[24]</sup>

NOTE 1 The actuator can take the form of a handle, knob, pushbutton, roller, plunger, trip wire, pressure-sensitive mat, etc.

NOTE 2 There are some actuating means that do not require an external actuating force, but only an action; e.g. light beams. Such actuating means are not considered to be actuators.

#### 3.2 armed condition

machine status in which machine motion can be automatically initiated

NOTE **Zero speed** (3.64) can be considered to be an armed condition.

#### 3.3 audible alarm

horn, bell or other distinctive audible warning device that sounds to indicate impending machine motion

#### 3.4 authorized person

person identified by management as having special training or designated to act in specified situations

NOTE Examples of “specified situations” include:

- special tasks to be performed;
- the function of the adjustments in the work zone;
- proper operation of adjustments and controls;

3) Available from National Fire Protection Agency, Batterymarch Park, Quincy, Massachusetts, USA 02169-7471; [www.nfpa.org](http://www.nfpa.org).

- all types of hazards in the area where the task is to be performed;
- the application of equivalent, alternative protection to perform the task;
- improper actions that can cause injury and the consequences of those improper actions.

**3.5****auxiliary device**

mechanism or machine, either built-in or attached, used for the production process

**3.6****barrier guard**

**guard** (3.21) that reduces or prevents physical access to a hazard zone by closing off access to an area containing one or more hazards

EXAMPLE A perimeter fence or tunnel guard.

**3.7****binding and finishing system**

combination of machines functioning in an integrated configuration to turn an incomplete printed product into a finished product by means of one or more processes, such as cutting, folding, binding, stitching, gluing, wrapping, etc.

**3.8****Category 0 stop  
uncontrolled stop**

stopping by immediate removal of power to the **machine actuators** (3.29)

[IEC 60204-1]

**3.9****Category 1 stop**

controlled stop with power available to the **machine actuators** (3.29) to achieve the stop and then removal of power when the stop is achieved

[IEC 60204-1]

**3.10****Category 2 stop**

controlled stop with power left available to the **machine actuators** (3.29)

[IEC 60204-1]

**3.11****continuous run**

machine motion at a steady speed initiated by a momentary-contact control

**3.12****control station**

defined location containing one or more controls

**3.13****control zone**

control configuration of single or multiple machine motions using the same control devices

NOTE See Clause 8.

**3.14**

**drive**

mechanism, divided into the following two general categories, which causes a machine or any of its elements to move:

- drives with no stored energy, which include, but are not limited to, direct-motor drives;
- drives having stored energy, which include, but are not limited to, motor-flywheel-clutch drives and hydraulic-pneumatic drives

**3.15**

**electrical hazard**

source of potential injury or death from electric shock or burn

NOTE Adapted from ISO 12100-1:2003.

**3.16**

**electro-sensitive protective device**

**ESPD**

apparatus that detects the presence of a person or part of a person or object in a defined area, using any detection means including, but not limited to, photoelectric, light screen, ultrasonic, etc.

**3.17**

**emergency stop device**

manually actuated control used to initiate an **emergency stop function** (3.18)

NOTE Adapted from ISO 13850:1996.

**3.18**

**emergency stop function**

mechanism activated by a single human motion and intended to halt machine activity in order to avoid injury to persons, damage to machinery or damage to work in progress

**3.19**

**exposing device**

machinery used for creating images by exposing photo-sensitive material such as printing plates or printing formes

**3.20**

**fixed guard**

**guard** (3.21) that is securely affixed by fasteners that require a tool(s) to remove in order to gain access to an area with a significant hazard

**3.21**

**guard**

physical barrier that restricts access to a significant hazard

**3.22**

**hazard point**

location of a hazard on a machine where a person can be injured

**3.23**

**hazard zone**

any area within and/or around machinery in which a person is exposed to risk of injury or damage to health

NOTE Adapted from ISO 12100-1:2003.

**3.24**

**hold-to-run control**

control that starts and maintains machine motion only as long as the control is activated

**3.25**  
**inch**  
**jog**

⟨operation of machinery⟩ machine motion requiring maintained activation engagement of a hold-to-run control and which will continue until the control is released or until a pre-determined displacement (limited inch) has been reached

**3.26**  
**infrequently used workplace**

area in which an activity is carried out, such as observation, make-ready, jam clearing, minor servicing, crossing inserting hoppers or conveyer belts, etc., that is routine, repetitive, integral to (but not necessarily during) production, and done only on an occasional basis

**3.27**  
**in-running nip**  
**in-going nip**

area created either by two rotating components that are rotating inward, or by one component rotating toward an adjacent surface

See Figure 1.

NOTE Rollers rotating in the same direction do not create a hazardous in-running nip if the rollers have the same surface characteristics and circumferential speeds.

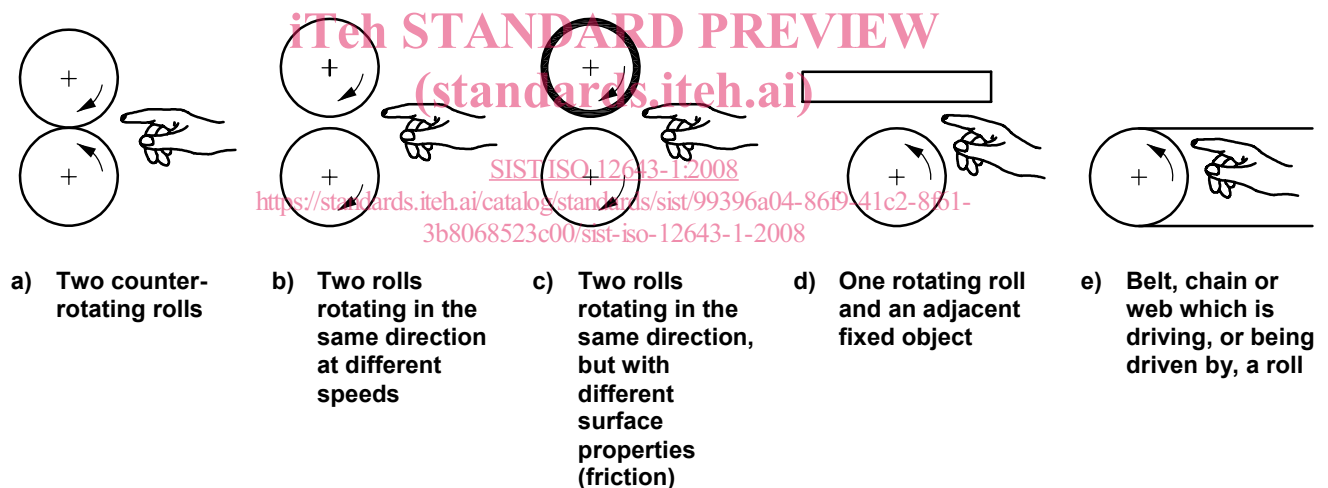

Figure 1 — In-running nips

**3.28**  
**interlock**

⟨for safeguarding⟩ arrangement that interconnects guard(s) or device(s) with the control system and/or all or part of the electrical energy distributed to the machine

[IEC 60204-1]

**3.29**  
**machine actuator**

power mechanism used to affect motion of a machine

[ISO 13850:1996]

**3.30**  
**maintained-contact control**

control that remains in an open or closed state after its activation
