## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 1927-3 was prepared by Technical Committee ISO/TC 33, *Refractories*.

ISO 1927 consists of the following parts, under the general title *Monolithic (unshaped) refractory products*:

- Part 1: Introduction and classification
- Part 2: Sampling for testing
- Part 3: Characterization as received
- Part 4: Determination of consistency of castables
- Part 5: Preparation and treatment of test pieces
- Part 6: Measurement of physical properties
- Part 7: Tests on pre-formed shapes
- Part 8: Determination of complementary properties

# Monolithic (unshaped) refractory materials —

## Part 3: Characterization as received

### 1 Scope

This part of ISO 1927 specifies the methods for the characterization of monolithic (unshaped) refractory materials as received and for checking the homogeneity of a delivery of a product. It is applicable to castables (dense and insulating), gunning materials tap hole clay, injection mixes, dry vibrating mixes, and ramming materials, as defined in ISO 1927-1.

NOTE A check list of appropriate tests is given in Annex A.

### 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 20565-3, *Chemical analysis of chrome-bearing refractory products and chrome-bearing raw materials (alternative to the X-ray fluorescence method) — Part 3: Flame atomic absorption spectrometry (FAAS) and inductively coupled plasma atomic emission spectrometry (ICP-AES)*

ISO 21068-1, *Chemical analysis of silicon-carbide-containing raw materials and refractory products — Part 1: General information and sample preparation*

ISO 21068-2, *Chemical analysis of silicon-carbide-containing raw materials and refractory products — Part 2: Determination of loss on ignition, total carbon, free carbon and silicon carbide, total and free silica and total and free silicon*

ISO 21068-3, *Chemical analysis of silicon-carbide-containing raw materials and refractory products — Part 3: Determination of nitrogen, oxygen and metallic and oxidic constituents*

ISO 21078-1, *Determination of boron (III) oxide in refractory products — Part 1: Determination of total boron (III) oxide in oxidic materials for ceramics, glass and glazes*

ISO 21078-2, *Determination of boron (III) oxide in refractory products — Part 2: Acid extraction method for the determination of boron (III) oxide in binder components*

ISO 21079-1, *Chemical analysis of refractories containing alumina, zirconia and silica — Refractories containing 5 % to 45 % of ZrO<sub>2</sub> (alternative to the X-ray fluorescence method) — Part 1: Apparatus, reagents and dissolution*

ISO 21079-2, *Chemical analysis of refractories containing alumina, zirconia, and silica — Refractories containing 5 % to 45 % of ZrO<sub>2</sub> (alternative to the X-ray fluorescence method) — Part 2: Wet chemical analysis*

ISO 21079-3, *Chemical analysis of refractories containing alumina, zirconia, and silica — Refractories containing 5 % to 45 % of ZrO<sub>2</sub> (alternative to the X-ray fluorescence method) — Part 3: Flame atomic absorption spectrophotometry (FAAS) and inductively coupled plasma emission spectrometry (ICP-AES)*

ISO 21587-1, *Chemical analysis of aluminosilicate refractory products (alternative to the X-ray fluorescence method) — Part 1: Apparatus, reagents, dissolution and gravimetric silica*

ISO 21587-2, *Chemical analysis of aluminosilicate refractory products (alternative to the X-ray fluorescence method) — Part 2: Wet chemical analysis*

ISO 21587-3, *Chemical analysis of aluminosilicate refractory products (alternative to the X-ray fluorescence method) — Part 3: Inductively coupled plasma and atomic absorption spectrometry methods*

ISO 26845, *Chemical analysis of refractories — General requirements for wet chemical analysis, atomic absorption spectrometry (AAS) and inductively coupled plasma atomic emission spectrometry (ICP-AES) methods*

### 3 Principle

Monolithic (unshaped) refractory products are characterized by making the following determinations:

- a) chemical composition;
- b) grain-size distribution by means of sieve analysis;
- c) moisture content of ramming materials;
- d) workability index of wet ramming materials.

It is not necessary to carry out all of these determinations to characterize a material.

## 4 Sampling

Take samples in accordance with the guidance given in ISO 1927-2 and prepare the quantities required by each individual determination.

## 5 Determination of chemical composition

### 5.1 Preparation of test sample

For ramming materials supplied wet, dry the samples (see Clause 4) in accordance with 6.5.1. For all samples, reduce the amount by coning and quartering and grind to the particle size required for chemical analysis.

NOTE The methods of chemical analysis used include the determination of loss on ignition.

### 5.2 Alumina-silica products

Determine the chemical composition in accordance with ISO 12677, ISO 14719, ISO 21078, ISO 26845 or ISO 21587, as appropriate.

Report the method used.

### 5.3 Basic products

Determine the chemical composition in accordance with ISO 12677, EN 15991, ISO 14720, ISO 28645 or ISO 10058 as appropriate.

Report the method used.

iTech STANDARD PREVIEW  
(standards.iteh.ai)  
ISO 1927-3:2012  
<https://standards.iteh.ai/catalog/standards/sist/cf7515ea-950c-453f-84d6-7c6bd3fac31b/iso-1927-3-2012>

### 5.4 Special products

Determine the chemical composition in accordance with ISO 12677, EN 15979, EN 15991, ISO 21068, ISO 14720, ISO 21079, ISO 26845 or ISO 20565 as appropriate.

The methods used shall be indicated in the test report.

### 5.5 Carbon-containing products

Carry out the elemental analysis of the oxide constituents on the calcined product, in accordance with either 5.2 or 5.3.

Any other non-oxide constituents should be analysed in accordance with in 5.4.

## 6 Determination of grain-size distribution

### 6.1 Principle

The grain-size distribution is measured by determining the amount of material retained on the range of sieves and is expressed as a percentage of the total initial dry mass of material.

### 6.2 Apparatus

**6.2.1 Balance**, capable of reading to the nearest 0,1 g.

**6.2.2 Sieves**, conforming to the requirements of ISO 565 and having a diameter of 200 mm or greater.

**6.2.3 Sieving apparatus.** The working characteristics of the apparatus shall be indicated (e.g. vibration characteristics, amplitude and frequency).

**6.2.4 Drying oven,** preferably with an exhaust.

**6.2.5 Soxhlet apparatus.**

**6.2.6 Electric hotplate or heating mantle.**

### 6.3 Quantity of sample

Take the following quantities of sample, from that obtained in Clause 4, for a single test, selecting in accordance with the maximum size of grains:

- a) maximum grain size up to 2 mm: 100 g;
- b) maximum grain size up to 6 mm: 250 g;
- c) maximum grain size up to 10 mm: 500 g;
- d) maximum grain size above 10 mm: 1 000 g

expressed in terms of dry material.

These quantities are related to dense materials. When testing insulating materials, the sample quantity may be reduced according to the bulk density without any reduction of the test accuracy. The reduced quantity shall be given in the test report.

(standards.iteh.ai)

### 6.4 Preparation of test samples

ISO 1927-3:2012

Reduce the sample in accordance with ISO 1927-2, taking care to avoid any fragmentation, to produce the required number of test portions, each of which complies with the minimum minimum quantity of sample given in 6.3.

In the case of ramming materials containing oil or tar, submit the sample to the following preliminary treatment, taking sufficient sample to enable reduction to be carried out after the pre-treatment.

Warm the sample in an evaporating dish and break it down with a spatula, taking care not to crush any of the grains. Place the sample in filter thimbles in one or more Soxhlets. Carry out the extraction with boiling toluene; an electric hotplate or a heating mantle being used as a means of heating. The extraction is complete when the toluene siphoned over is colourless.

### 6.5 Procedure

#### 6.5.1 Drying and measurement of dry sample mass

Samples of castables, gunning materials, dry mixes and ramming materials, following the removal of oil or tar shall be dried at  $(110 \pm 5)$  °C to constant mass and cooled to ambient temperature.

Weigh the test sample to the nearest 0,1 g and record the mass as  $m_1$ .

Ramming materials containing fine particles and non-organic liquid are not dried before sieving in order to avoid hardening and difficult dispersion (see 6.5.2.3). A separate sample is used to determine the moisture

content of the material using the method given in Clause 7. Calculate the mass of dry material contained in the test sample for sieving,  $m_1$ , using the equation:

$$m_1 = m_0 - \left( \frac{m_c \cdot m_0}{100} \right)$$

where

$m_0$  is the mass of the test sample as received i.e. prior to any drying, in grams;

$m_1$  is the mass of the test sample, in grams;

$m_c$  is the moisture content determined using a separate sample, in percent.

## 6.5.2 Sieving

### 6.5.2.1 General

Two methods may be used for sieving using sieves conforming to the requirements of ISO 565 and taken from the following range:

- 0,063 mm
- 0,125 mm
- 0,25 mm
- 0,5 mm
- 1,0 mm
- 2,0 mm
- 4,0 mm
- 8,0 mm
- 16,0 mm

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

ISO 1927-3:2012

<https://standards.iteh.ai/catalog/standards/sist/cf7515ea-950c-453f-84d6-7c6bd3fac31b/iso-1927-3-2012>

### 6.5.2.2 Direct dry sieving

This is a quick method and should be used only for materials containing few particles of size less than 10  $\mu\text{m}$ . The test sample, prepared and weighed in accordance with 6.5.1 is sieved using the selected sieves, a receiver and an appropriate efficient sieve shaker. The total time of sieving shall not exceed 15 min. Weigh the material remaining on each sieve and record the masses as  $m_n$  where  $n$  is the mesh size of the sieve.

### 6.5.2.3 Dry sieving after washing

This method may be used for all materials and is the preferred method for quality control and referee purposes; it is the essential method for samples of wet ramming materials containing fine particles and non-organic liquid which have not been dried prior to sieving (see 6.5.1).

The sample, prepared in accordance with 6.5.1, shall be washed on a fine sieve, of aperture 0,063 mm or 0,125 mm. Use a shower for diluting and washing the mass. Hand sieve the material under the water flow, using a to and fro movement. Stop washing as soon as the water passing through the sieve does not carry fine particles and becomes translucent.

Remove the retained material from the sieve, dry at  $(110 \pm 5)^\circ\text{C}$  to constant mass, cool to ambient temperature and weigh to of the nearest 0,1 g. Record the mass as  $m_2$ .
