Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 3233-1 was prepared by Technical Committee ISO/TC 35, *Paints and varnishes*, Subcommittee SC 9, *General test methods for paints and varnishes*.

It cancels and replaces ISO 3233:1998, which has been technically revised. It also incorporates the Technical Corrigendum ISO 3233:1998/Cor.1:1999.

In addition to the change in number, the main changes are as follows:

- iTeh STANDARD PREVIEW**
(standards.iteh.ai)
- a) definitions of non-volatile matter, spreading rate and practical dry-film density have been added;
 - b) the determination is now carried out in triplicate rather than in duplicate;
 - c) a calculation of the spreading rate has been added; <https://standards.iteh.ai/catalog/standards/sist/b581de1d-2c74-43d5-8580-80a9c442548/iso-3233-1-2013>
 - d) the symbols have been harmonized with those used in ISO 23811;
 - e) in Annex A, an additional drying class (class 3) has been added for water-borne coating materials;
 - f) the text has been editorially revised and the normative references updated.

ISO 3233 consists of the following parts, under the general title *Paints and varnishes — Determination of percentage volume of non-volatile matter*:

- *Part 1: Method using a coated test panel to determine non-volatile matter and to determine dry film density by the Archimedes principle*
- *Part 2: Method using the determination of non-volatile-matter content in accordance with ISO 3251 and and determination of dry film density on coated test pannels by the Archimedes principle*
- *Part 3: Determination by calculation from the non-volatile-matter content determined in accordance with ISO 3251, the density of the coating material and the density of the solvent in the coating material¹⁾*

1) In preparation, replacing ISO 23811:2009.

Introduction

This method is used to measure the density and to determine the volume of a dry coating obtainable from a given volume of liquid paint. This volume is considered to be the most meaningful measure of the coverage (area of surface covered at a specified dry-film thickness per unit volume) of a paint, varnish or related product. The value obtained by this method might not be the same as that calculated on the basis of the addition of masses and volumes of the raw materials in a formulation. The volume occupied by a combination of resin and solvent can be the same as, greater than or less than the combined volume of the separate components, due to contraction or expansion of the resin and solvent. A second factor affecting the volume of a dry coating formulation is the degree to which the spaces between pigment particles are filled with binder. A third factor is the use of volatile components in reactive systems that, by their reaction, change into non-volatile film-building materials, i.e. amines and reactive solvents in high-build two-component coating materials.

Above and close to the critical pigment volume concentration, the volume of a dry paint film is greater than the theoretical volume, due to an increase in unfilled voids between pigment particles. The porosity of the film means that this method is unsuitable.

The values obtained for the non-volatile matter by volume are dependent on the temperature and time of heating, and these conditions should be carefully considered for the material being tested.

Paints and varnishes — Determination of the percentage volume of non-volatile matter —

Part 1:

Method using a coated test panel to determine non-volatile matter and to determine dry film density by the Archimedes principle

1 Scope

This part of ISO 3233 describes a procedure for determining the non-volatile matter by volume, NV_V , of coating materials and related products by measuring the density of a dried coating for any specified temperature range and period of drying or curing. This method determines the non-volatile matter immediately after application.

Using the non-volatile matter by volume results obtained in accordance with this part of ISO 3233, it is possible to calculate the spreading rate of coating materials.

The method specified in this part of ISO 3233 is the preferred method for air-drying materials. Its use for other materials still has to be tested.

This part of ISO 3233 is not applicable to coating materials in which the critical pigment volume concentration is exceeded.

2 Normative references

ISO 2811-2, *Paints and varnishes — Determination of density — Part 2: Immersed body (plummet) method*

ISO 2811-3, *Paints and varnishes — Determination of density — Part 3: Oscillation method*

ISO 2811-4, *Paints and varnishes — Determination of density — Part 4: Pressure cup method*

ISO 4618, *Paints and varnishes — Terms and definitions*

ISO 15528, *Paints, varnishes and raw materials for paints and varnishes — Sampling*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 4618 and the following apply.

3.1 non-volatile matter NV

residue by mass obtained by evaporation under specified conditions

[ISO 4618:2006]

NOTE This part of ISO 3233 and ISO 3251 specify different conditions for the determination of NV. Therefore in this part of ISO 3233, the symbol NV_m is used for non-volatile matter by mass.

3.2 non-volatile matter by volume NV_v

percentage residue by volume obtained by evaporation under specified conditions

3.3 spreading rate s

surface area that can be covered by a given quantity of coating material to give a dried film of the required thickness

NOTE It is expressed in m^2/l or m^2/kg .

3.4 practical dry-film density ρ_p

practically determined density of a dried and cured coating

iteh STANDARD PREVIEW
(standards.iteh.ai)
<https://standards.iteh.ai/catalog/standards/sist/b581de1d-2c74-43d5-8580-80a9c44f348/iso-3233-1-2013>

4 Principle

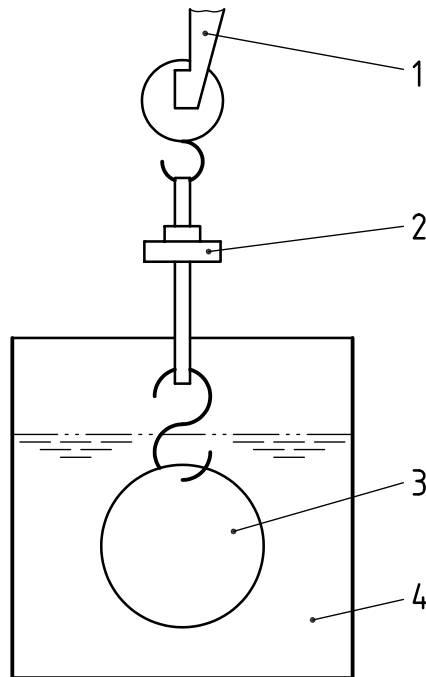

A receptacle (disc or plate) is weighed in air and in water (or other suitable liquid of known density), coated with the product to be tested, dried and reweighed in air and in the same liquid. From these measurements, the mass, the volume and hence the density of the dry coating are calculated. The non-volatile matter by volume is calculated from the quotient of the density of the coating material and the density of the dry film.

5 Apparatus and reagents

Standard laboratory apparatus, together with the following:

5.1 Analytical balance, accurate to 0,1 mg.

A single-pan balance is most convenient, and a useful modification is to replace the balance pan by a standard counterweight attachment as shown in Figure 1.

**Key**

- 1 balance arm
- 2 standard counterweight attachment
- 3 disc
- 4 immersion liquid

ITIH STANDARD PREVIEW
 (standards.iteh.ai)

ISO 3233-1:2013
Figure 1 — Special balance support

<https://standards.iteh.ai/catalog/standards/sist/b581de1d-2c74-43d5-8580-80a9c44ff348/iso-3233-1-2013>

5.2 Receptacle (see 7.2).

5.2.1 Disc, about 60 mm in diameter and about 0,7 mm thick, with a small hole 2 mm to 3 mm from the edge.

NOTE A stainless-steel disc has been found satisfactory but has the disadvantage of having a density much in excess of normal liquid coatings. Discs of lighter material, including plastics, for example poly(ethylene terephthalate), are permitted provided they do not change in volume by contact with the solvents contained in the liquid coating, or during the heating and drying processes involved.

5.2.2 Plate, of size (75 ± 5) mm by (120 ± 5) mm, with a small hole 2 mm to 3 mm from the shorter side on the longitudinal axis of the panel.

Glass plates may be used as these are very flat. However, drilling a hole is difficult and therefore, if glass plates are used, they should preferably be suspended in a stirrup or cradle of thin wire (see Figure 2). The diameter of the wire shall not exceed 0,3 mm because of surface tension effects.

Plates of this size might be difficult to accommodate in a balance case. Smaller plates may therefore be used provided the coated area is no less than 5 600 mm².

Key

- 1 balance arm
- 2 standard counterweight attachment
- 3 wire cradle
- 4 plate
- 5 immersion liquid

<https://standards.iteh.ai/catalog/standards/sist/b581de1d-2c74-43d5-8580-80a9c44f348/iso-3233-1-2013>
 ISO 3233-1:2013

Figure 2 — Wire cradle support for plate

5.3 Hook, made of stainless steel or synthetic thread, for attaching the receptacle to the balance during weighing operations. The diameter of the wire shall not exceed 0,3 mm because of surface tension effects.

5.4 Beaker, of size convenient for immersing the receptacle with a clearance of at least 10 mm and which can be accommodated in the balance case.

5.5 Support, for holding the beaker under the balance stirrup without jamming the pan damper, if a counterweight as recommended in 5.1 is not available.

5.6 Immersion liquid, of suitable density, in which the receptacle is immersed.

Distilled water is suitable for most coating materials. An organic liquid which does not affect the paint film may also be used.

5.7 Desiccator, containing a drying material.

5.8 Air oven, capable of maintaining the specified or agreed test temperature (see Annex A) to ± 2 °C (for temperatures up to 150 °C) or $\pm 3,5$ °C (for temperatures above 150 °C and up to 200 °C). An air oven with forced ventilation shall be used.

WARNING — To protect against explosions and fire, careful handling of products containing flammable volatile materials is essential.

Air ovens of the same type shall be used by all parties for referee tests.

6 Sampling

Take a representative sample of the coating material to be tested, as described in ISO 15528.

Examine and prepare the test samples, as described in ISO 1513.

7 Procedure

7.1 Number of determinations and preparation

Carry out the determination in triplicate.

Samples may be applied to discs or plates by dipping, brushing or applicator as described in 7.4.

Examples of test temperatures and times of heating that may be used for various types of coating material are given in Annex A.

7.2 Choice of receptacle

The choice of receptacle (disc or plate) will depend on the type of coating being measured. Discs should preferably be used for paints of low viscosity and paints which are thinned for spray application. Plates may be used for thixotropic and other coatings which can be drawn down with a doctor blade or for paints applied by dipping or by spin coating.

ISO 3233-1:2013

7.3 Determination of volume of uncoated receptacle

<https://standards.iteh.ai/catalog/standards/sist/b581de1d-2c74-43d5-8580-80a9c44b548/iso-3233-1-2013>

7.3.1 Dry the receptacle (5.2) and suspension hook (5.3) in the oven (5.8), if required, at the recommended temperature for 10 min, cool in the desiccator (5.7) and weigh the receptacle in air. Record this mass as m_1 .

7.3.2 Place in the beaker (5.4) sufficient of the liquid (5.6) to ensure that it will be at least 10 mm above the top of the suspended receptacle (see Figure 3). Indicate the level on the side of the beaker and check that this level is maintained throughout the determination. The temperature of the liquid should preferably be $(23 \pm 1) ^\circ\text{C}$. Suspend the receptacle in the liquid (see the note) and again weigh it. Record this mass as m_2 .

NOTE If water is used as the immersion liquid, 1 or 2 drops of a suitable wetting agent will help to ensure rapid and thorough wetting of the receptacle.

7.3.3 Record the temperature of the liquid and determine its density at this temperature (see 7.6). Record the density as ρ_1 .
