To expedite distribution, this document is circulated as received from the committee secretariat. ISO Central Secretariat work of editing and text composition will be undertaken at publication stage.

Pour accélérer la distribution, le présent document est distribué tel qu'il est parvenu du secrétariat du comité. Le travail de rédaction et de composition de texte sera effectué au Secrétariat central de l'ISO au stade de publication.

THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 13099-3 was prepared by Technical Committee ISO/TC 24, *Particle characterization including sieving*, Subcommittee SC 4, *Particle characterization*.

ISO 13099 consists of the following parts, under the general title *Colloidal systems — Methods for zeta potential determination*:

- *Part 1: Electroacoustic and electrokinetic phenomena*
- *Part 2: Optical methods*

The following part is under preparation:

- *Part 3: Acoustic methods*

Introduction

Zeta potential is a parameter that can be used to predict the long term stability of suspensions and emulsions and to study surface morphology and surface adsorption of particles and other surfaces in contact with a liquid. Zeta potential is not a directly measurable parameter. It can be determined using appropriate theoretical models from experimentally determined parameters, which depend on electric charge separation at interfaces. “Electrokinetic phenomena” encompass such experimentally observed effects. A group of electrokinetic phenomena at high frequency on MHz scale is referred to as “electroacoustics” [1]. Each classical electrokinetic phenomenon at DC or low AC conditions has electroacoustic analogue. These electroacoustic phenomena have been widely used to determine electrophoretic mobility of various concentrated particulates without sample dilution. The purpose of this part of the ISO standard in methods for Zeta potential determination is description of general features of such electroacoustic methods that should be common for all instrumental implementation for measuring electrophoretic mobility using electroacoustics and following calculation of zeta potential of particulates.

Colloidal systems — Methods for zeta potential determination — Part 3: Acoustic methods

1 Scope

This part of ISO 13099 describes in general electroacoustic effects that can be defined as high frequency electrokinetic phenomena.

Particular attention is given to two methods of measurement of electrophoretic mobility of particles suspended in a liquid at high concentration above 1 % vI, colloid vibration current (CVI) [2] and electric sonic amplitude (ESA) [3, 4], respectively.

Estimation of surface charge and determination of zeta potential may be achieved from measured electrophoretic mobility using proper theoretical models, which are described in detail in ISO 13099, Part 1.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 13099-2:2012, *Colloidal systems — Methods for zeta potential determination — Part 2: Optical methods*

3 Terms, definitions and symbols

For the purposes of this document, the following terms and definitions apply.

3.1 Electric double layer (EDL)

NOTE The electric double layer (EDL) is a spatial distribution of electric charges that appears on and at the vicinity of the surface of an object when it is placed in contact with a liquid.

3.1.1

Debye-Hückel approximation

model assuming small electric potentials in the electric double layer

3.1.2

Debye length

κ^{-1}

characteristic length of the electric double layer in an electrolyte solution

NOTE 1 to entry: The Debye length is expressed in nanometers.

3.1.3

diffusion coefficient

D

mean squared displacement of a particle per unit time

3.1.4

Dukhin number

Du

dimensionless number which characterizes contribution of the surface conductivity in electrokinetic and electroacoustic phenomena, as well as in conductivity and dielectric permittivity of heterogeneous systems

3.1.5

dynamic viscosity

η

ratio of the applied shear stress and the rate of shear of a liquid

NOTE 1 to entry: For the purpose of this part of ISO 13099, dynamic viscosity is used as a measure of resistance of a fluid which is being deformed by shear stress.

NOTE 2 to entry: Dynamic viscosity determines the dynamics of an incompressible Newtonian fluid.

NOTE 3 to entry: Dynamic viscosity is expressed in pascal seconds.

3.1.6

electric surface charge density

σ

charges on interface per area due to specific adsorption of ions from the liquid bulk, or due to dissociation of the surface groups

NOTE 1 to entry: Electric surface charge density is expressed in coulombs per square metre.

3.1.7

electric surface potential

ψ^s

difference in electric potential between the surface and the bulk liquid

NOTE 1 to entry: Electric surface potential is expressed in volts.

3.1.8

ζ -potential electrokinetic potential zeta potential

ζ

difference in electric potential between that at the slipping plane and that of the bulk liquid

NOTE 1 to entry: Electrokinetic potential is expressed in volts.

3.1.9

Gouy-Chapman-Stern model

model describing the electric double layer

3.1.10

isoelectric point

condition of liquid medium, usually the value of pH, that corresponds to zero zeta-potential of dispersed particles

3.1.11

slipping plane

shear plane

abstract plane in the vicinity of the liquid/solid interface where liquid starts to slide relative to the surface under influence of a shear stress

3.1.12**Stern potential** φ^d

electric potential on the external boundary of the layer of specifically adsorbed ions

NOTE 1 to entry: Stern potential is expressed in volts.

3.2 Electrokinetic phenomena

NOTE 1 to entry: Electrokinetic phenomena are associated with tangential liquid motion adjacent to a charged surface.

3.2.1**electroosmosis**

motion of liquid through or past a charged surface, e.g. an immobilized set of particles, a porous plug, a capillary or a membrane, in response to an applied electric field, which is the result of the force exerted by the applied field on the countercharge ions in the liquid

3.2.2**electroosmotic counter-pressure** Δp_{eo}

pressure difference that is applied across the system to stop the electroosmotic flow

NOTE 1 to entry: The electroosmotic counter-pressure value is positive if the high pressure is on the higher electric potential side.

NOTE 2 to entry: Electroosmotic counter-pressure is expressed in pascals.

3.2.3**electroosmotic velocity** v_{eo}

uniform velocity of the liquid far from the charged interface

NOTE 1 to entry: Electroosmotic velocity is expressed in metres per second.

3.2.4**electrophoresis**

movement of charged colloidal particles or polyelectrolytes, immersed in a liquid, under the influence of an external electric field

3.2.5**electrophoretic mobility** μ

electrophoretic velocity per unit electric field strength

NOTE 1 to entry: Electrophoretic mobility is positive if the particles move toward lower potential (negative electrode) and negative in the opposite case.

NOTE 2 to entry: Electrophoretic mobility is expressed in metres squared per volt second.

3.2.6**electrophoretic velocity** v_e

particle velocity during electrophoresis

NOTE 1 to entry: Electrophoretic velocity is expressed in metres per second.

3.2.7

sedimentation potential

U_{sed}

potential difference sensed by two electrodes placed some vertical distance apart in a suspension in which particles are sedimenting under the effect of gravity

NOTE 1 to entry: When the sedimentation is produced by a centrifugal field, the phenomenon is called centrifugation potential.

NOTE 2 to entry: Sedimentation potential is expressed in volts.

3.2.8

streaming current

I_{str}

current through a porous body resulting from the motion of fluid under an applied pressure gradient

NOTE 1 to entry: Streaming current is expressed in amperes.

3.2.9

streaming current density

J_{str}

streaming current per area

NOTE 1 to entry: Streaming current density is expressed in coulombs per square metre.

3.2.10

streaming potential

U_{str}

potential difference at zero electric current, caused by the flow of liquid under a pressure gradient through a capillary, plug, diaphragm or membrane

NOTE 1 to entry: Streaming potentials are created by charge accumulation caused by the flow of countercharges inside capillaries or pores.

NOTE 2 to entry: Streaming potential is expressed in volts.

3.2.11

surface conductivity

K^{σ}

excess electrical conduction tangential to a charged surface

NOTE 1 to entry: Surface conductivity is expressed in siemens.

3.3 Electroacoustic phenomena

NOTE 1 to entry: Electroacoustic phenomena arise due to the coupling between the ultrasound field and electric field in a liquid that contains ions. Either of these fields can be primary driving forces. Liquid might be a simple newtonian liquid or complex heterogeneous dispersion, emulsion or even a porous body. There are several different electroacoustic effects, depending on the nature of the liquid and type of the driving force.

3.3.1

colloid vibration current

CVI

A_{cvi}

a.c. current generated between two electrodes, placed in a dispersion, if the latter is subjected to an ultrasonic field

NOTE 1 to entry: Colloid vibration current is expressed in amperes.
