Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

ISO 3315 was prepared by Technical Committee ISO/TC 29, *Small tools*, Subcommittee SC 10, *Assembly tools for screws and nuts, pliers and nippers*.

This fourth edition cancels and replaces the third edition (ISO 3315:1996), which has been technically revised.

4 Driving squares

Driving squares shall be in accordance with ISO 1174-1, and shall have a minimum hardness of 39 HRC.

5 Torque testing

5.1 Method

Place the tool in a female test square and apply the corresponding torque.

Do not jerk or strike the tool when testing and apply the load gradually until the minimum testing torque (see Table 1) is reached.

The across-flats dimension of the female test square shall be equal to the minimum dimension of the corresponding female square (see ISO 1174-1) with a tolerance of H8; the female test square shall be hardened to not less than 55 HRC.

A device in which the female test square can be rotated at a certain torque, determined to an accuracy of $\pm 2,5\%$, may also be used for this test.

Following the application of the minimum test torsion torque, any possible damage or deformation shall not affect the usability of the tool.

5.2 Special requirements

STANDARD PREVIEW
(standards.iteh.ai)

5.2.1 Test of T-handle, square drive

Draw out the handle completely at one end and apply the load to the end furthest from the test square.

<https://standards.iteh.ai/catalog/standards/sist/749bccbb-2a5a-447-a1d0-b2bf8c233b92/iso-3315-2011>

5.2.2 Test of speeder, brace type

Apply the load in the middle of the part on which the operator's hand normally rests.

5.2.3 Test of ratchet handle and ratchet handle, reversible

Apply the load as close as possible to the end of the handle.

For tools having a reversible ratchet, the test shall be carried out in both directions.

5.2.4 Test of screwdriver, external square

An appropriate appliance shall allow the load to be applied to the screwdriver without clamping the screwdriver on the rod, which can alter the test result.

5.2.5 Test of nut spinner, flex head

Apply the load as close as possible to the end of the handle, which is placed at right angles to the axis of the square.

5.2.6 Test of offset handle, square drive

Apply the load as close as possible to the end of the handle.
