(standards.iteh.ai)
Full standard:
<https://standards.iteh.ai/catalog/standards/sist/94bd0267-95d1-483b-9412-7d88b2a3705a2/iso-13577-2-2014>

To expedite distribution, this document is circulated as received from the committee secretariat. ISO Central Secretariat work of editing and text composition will be undertaken at publication stage.

Pour accélérer la distribution, le présent document est distribué tel qu'il est parvenu du secrétariat du comité. Le travail de rédaction et de composition de texte sera effectué au Secrétariat central de l'ISO au stade de publication.

THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

D R A F T

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 13577-2 was prepared by Technical Committee ISO/TC 244, *Industrial furnaces and associated processing equipment*, Subcommittee SC , .

ISO 13577 consists of the following parts, under the general title *Industrial furnaces and associated processing equipment — Safety*:

- Part 1: *General requirements*
- Part 2: *Combustion and fuel handling systems*
- Part 3: *Generation and use of protective and reactive atmosphere gases*
- Part 4: *Protective Systems*

Introduction

This document is a Type C-Standard as defined in ISO 12100.

The machinery concerned and the extent to which hazards, hazardous situations and events are covered, is indicated in the scope of this document.

When provisions of this type C standard are different from those which are stated in type A or B standards, the provisions of this type C standard take precedence over the provisions of the other standards, for machines that have been designed and built according to the provisions of this type C standard.

This DIS 13577-2 assumes that the equipment is not creating any potentially explosive atmosphere and is located in a normally ventilated area.

Compliance with product standards e.g. ISO 22967 or ISO 22968 is not sufficient to ensure the minimum safety requirement for TPE. This DIS shall always have priority for TPE.

Industrial Furnaces and Associated Processing Equipment (TPE) generally consists of the following components:

- Processing chamber (e.g. steel construction with lining and/or refractory)
- Heating systems
- Protective system
- Control and instrumentation system / operator-control level

ISO 13577-1 provides the general safety requirements common to TPE. This part of ISO 13577 details in addition specific safety requirements for combustion and fuel handling systems that are part of TPE as listed in the scope.

NOTE As stated in its scope, ISO 13577-1 does not cover blast furnaces, converters (in steel plants), boilers and equipment not covered under ISO 12100.

The requirements of protective system are specified in ISO 13577-4.

If a general provision of ISO 13577-1 counters provisions in this part of ISO 13577, the provisions of this part of ISO 13577 takes precedence.

Although noise can be a significant hazard for combustion and fuel handling systems, it is not dealt with in this standard.

It is assumed that TPE will only be operated and maintained by trained personnel.

Industrial furnaces and associated processing equipment — Safety —

Part 2: Combustion and fuel handling systems

1 Scope

This part of ISO 13577 specifies the safety requirements for combustion and fuel handling systems that are part of industrial furnaces and associated processing equipment (TPE).

NOTE The general safety requirements common to TPE are provided in ISO 13577-1 (See introduction).

This part of ISO 13577 deals with significant hazards, hazardous situations and events relevant to combustion and fuel handling systems as listed in Annex A, when used as intended and under the conditions foreseen by the manufacturer.

This part of ISO 13577 covers:

- Fuel pipework downstream of and including the manual isolating valve;
- Burner(s), burner system and ignition device;
- Functional requirements for safety related control system;
- Oxygen, oxygen enriched, or combustion air supply, and the flue gas system.

This part of ISO 13577 applies to any oxidation with air or other gases containing free oxygen of gaseous and liquid fuels or any combustion of them to release thermal energy in TPE.

For thermal or catalytic post combustion and waste incineration, this International Standard applies only to auxiliary burners designed to start-up and/or support the process.

The pressure hazard of the piping and components covered by this standard is within the maximum pressure/size relationship of category I as described in normative Annex E.

This part of ISO 13577 also gives the necessary requirements for the information for use.

This part of ISO 13577 does not cover hazards from heating generated by electricity.

This part of ISO 13577 does not deal with the hazards created by the release of flammable substances from the products processed in the TPE.

This part of ISO 13577 is not applicable to Combustion and fuel handling systems:

- of welding machines;
- up-stream of the TPE manual isolating valve.

This part of ISO 13577 is not applicable to electrical cabling and power cabling upstream of the TPE control panel/protective system.

Noise can be a significant hazard for combustion and fuel handling systems. It is not dealt with in this standard.

31 2 Normative references

32 The following referenced documents are indispensable for the application of this International Standard. For
33 dated references, only the edition cited applies. For undated references, the latest edition of the referenced
34 document (including any amendments) applies.

 68 *requirements for automatic electrical burner control systems*

69 IEC 60730-2-6:2007, *Automatic electrical controls for household and similar use - Part 2-6: Particular*
 70 *requirements for automatic electrical pressure sensing controls including mechanical requirements*

71 IEC 61511 (all parts), *Functional safety – Safety instrumented systems for the process industry sector*

72 IEC 62061, *Safety of machinery – Functional safety of safety-related electrical, electronic and programmable*
 73 *electronic control systems*

74 **3 Terms and definitions**

75 The terms and definitions used in this International Standard are defined in ISO 13574.

76 **4 Safety Requirements, Measures and Verification Means**

77 **4.1 General**

78 The safety goals of this International Standard shall include:

- 79 — choice of materials such that the construction and operation of the system are not detrimentally
 80 affected. In particular, all the components of the fuel pipework shall be capable of withstanding the
 81 mechanical, chemical and thermal loads to which they can be subjected during normal operation and
 82 foreseeable abnormal operation (e.g. identified during a safety assessment);
- 83 — reliable and correct time for ignition of the air/fuel mixture at the burner(s);
- 84 — prevention of unintentional release of unburned fuels;
- 85 — shut-off fuel-supply in case of relevant fault;
- 86 — protection of pipeline to preclude the propagation of flame in reverse direction;
- 87 — prevent firing when the evacuation of flue gas/combustion products is not ensured;
- 88 — prevent firing when the process conditions are not in the safe state.

89 Electrical circuits shall be designed in accordance with IEC 60204-1.

90 A risk assessment according to ISO 12100 shall be carried out. Safety function shall be designed in
 91 accordance with ISO 13577-4, where the use of standards for functional safety IEC 62061, ISO 13849, IEC
 92 61511 and IEC 61508 is included. Informative Annex F provides information for the determination of the SIL or
 93 PL of safety-related functions.

94 Specific regional requirements are given in Annex G, H and I. The safety requirements of this Annex shall
 95 ensure at least the equivalent level of safety to the requirements given in this Standard.

96 **4.2 Gaseous fuels**

97 **4.2.1 Gas pipework**

98 **4.2.1.1 General**

99 The pipework design shall take into account the composition and properties (e.g. pressure, temperature,
100 corrosiveness, specific gravity) of the fuel gas and the need for venting, purging and cleaning.

101 The pipework material shall comply with the relevant standards.

102 Due to durability, steel is the preferred material for pipes and components but where appropriate and the
103 same safety levels can be achieved then other materials may be utilized. Such materials and conditions of
104 service shall be specified in the instruction handbook. Oscillations which may cause damage to pipework,
105 components or safety systems shall be prevented (by firm anchoring and/or use of flexible couplings).

106 **4.2.1.2 Connections**

107 Gas pipework connections shall be metallic and shall be of threaded, compression, flanged, welded or brazed
108 types. The number of connections shall be kept to a minimum.

109 Threaded connections shall be used only for the following pressure/diameter combinations:

110 — pressures up to 15 kPa, and diameters up to DN 100

111 — pressures up to 200 kPa, and diameters up to DN 50

112 — pressures up to 500 kPa, and diameters up to DN 25

113 — pressures up to 1 MPa, and diameters up to DN 15

114 For fittings according to ISO 49, the following limitations shall be observed:

115 — fittings must be class "A";

116 — maximum allowed pressure is 50 kPa;

117 — for dimensions DN25 or less, the maximum pressure is 600 kPa.

118 Where the equipment has a threaded connection, this thread shall comply with ISO 228-1 or ISO 7-1 as
119 appropriate. The use of threads complying with ISO 228-1 is limited to diameter up to DN 50. In case of
120 threads according to ISO 228-1, the tightness shall be ensured by a ring gasket. In case of threads according
121 ISO 7-1 suitable sealants shall be used to ensure tightness. Hemp shall not be used in threaded connections
122 unless reinforced with a suitable sealant.

123 Other threaded connections may only be used providing they ensure tight connections and are suitably
124 identified.

125 The design of pipework shall be such as to avoid tensile loading of the joints.

126 Compression fittings shall comply with ISO 8434-1, 2 and 3 or ISO 19879. They shall only be used for
127 pressures up to 500 kPa and diameters up to 42 mm.

128 Any pipe passing through an unventilated space shall not have a connection except welded joints.

129 Flanges shall comply with ISO 7005, Part 1 and 2 as appropriate.

130 Arc welding shall comply with ISO 5817, quality Level C.

131 4.2.1.3 Unconnected pipework

132 Any unconnected pipework shall be plugged, capped or blank flanged by means of metallic parts.

133 4.2.1.4 Galvanic cells

134 The formation of galvanic cells shall be avoided by suitable choice of materials.

135 4.2.1.5 Flexible tubing and couplings

136 Flexible tubing shall comply with the general requirements of 4.2.1.1, together with the following:

137 — shall be as short as practicable;

138 — shall be suitable for the maximum and minimum working (fuel and ambient) temperatures;

139 — shall be suitable for a pressure 1,5 times the working operating pressure (with a minimum of 15 kPa),
140 at the maximum and minimum working temperatures;

141 — shall have a directly accessible, upstream manual shut-off valve;

142 — shall be mounted in such a way as to avoid distortion, whiplash and damage;

143 — shall have end fittings as integral parts of the tubing;

144 — shall be constructed from suitable material both metallic and/or non-metallic selected for the
145 application duty and not be easily damaged.

146 Couplings for removable equipment shall ensure a gastight connection with the equipment connected and
147 disconnected.

148 4.2.1.6 Marking

149 The pipework shall be identified as gas pipework.

150 NOTE Identification of gas pipework is dealt with by national regulations.

151 4.2.1.7 Soundness/tightness

152 The gas pipework shall be tight and shall be designed to withstand the internal pressure. After assembly, the
153 gas pipework shall be submitted to its test pressure and tested for tightness. The test pressure shall be not
154 less than 1.1 times the maximum working pressure at any point with a minimum of 5 kPa.

155 The external leakage rate shall not give rise to a dangerous condition, flammable and/or toxic, in the foreseen
156 circumstances of the equipment installation. The frequency of testing to determine the external leakage shall
157 be specified in the instruction handbook.

158 NOTE It is generally agreed that an external leak rate of $\sim 1\text{dm}^3(\text{n})/\text{h}$ will not give rise to a dangerous condition in
159 typical ventilated industrial installations. The actual leak rate will depend upon the volume, number of connections, test
160 gas, number of valves and component parts contained.

161 The external leak rate test method shall take into account the volume, number of connections, test gas,
162 number of valves and component parts contained and temperature. Methods of testing shall include spray
163 bubble leak identification and/or pressure decay test.

164 **4.2.1.8 Condensate drains**

165 In cases where condensates can create a hazard, means shall be provided at the lowest points of the
 166 equipment for draining any condensate. When moist gases are being used, condensate drains of a suitable
 167 type shall be installed. Any condensate drains, siphons, etc. shall be in a position such that they can be easily
 168 checked. Flammable condensates shall be collected by an appropriate means (e.g. piped into a container).

169 Valves in condensate drains shall be suitably plugged, capped or blank flanged by metallic parts.

170 **4.2.1.9 Purge points**

171 Means shall be provided to facilitate purging of the gas system during commissioning and maintenance to
 172 prevent the build-up of flammable substances.

173 **4.2.1.10 Blow-off and breather pipes or conduits**

174 Where blow-off or breather pipes or conduits are fitted on regulators or relief valves or vent valves, adequate
 175 means shall be provided to facilitate the venting of gas from the system to a safe discharge area.

176 In case breathers or blow-off pipes are gathered, the cross section of the collector shall be suitable to
 177 evacuate simultaneously total flow rates of the exhaust sources.

178 **4.2.1.11 Pressure relief devices and flame arrestors on pipework**

179 For equipment designed for situations in which flashback can occur, flame arrestors and/or pressure relief
 180 devices shall be fitted.

181 Pressure relief devices shall be designed to yield at a pressure below the design pressure of the pipework and
 182 shall be positioned such that the discharge flow and the pressure relief device does not constitute a risk to the
 183 equipment, personnel or third parties.

184 A flashback at least shall trigger an alarm. The required measures after a flashback shall be described in the
 185 instruction handbook.

186 **4.2.1.12 Pressure oscillations**

187 The gas pipework shall be designed so as to avoid the possibility of gas velocities and pressure fluctuations
 188 causing oscillations which could cause damage to pipework, components or safety systems (e.g. by designing
 189 the correct sizing of pipe, using pressure regulator,).

190 **4.2.1.13 Equipment supplied with different fuel gases**

191 Where a burner is intended for alternating use with more than one gaseous fuel, means shall be provided to
 192 ensure that the supply pipework of the gas not being fired is positively isolated.

193 **4.2.1.14 By-pass**

194 By-passes shall not be fitted in parallel with any item of safety equipment.

195 This requirement shall not apply to valve proving systems (ISO 23551-4) on automatic shut-off valves.

196 **4.2.1.15 Isolation of required safety devices**

197 Required safety devices (e.g. pressure switches, relief valves) shall not be isolated from the equipment they
 198 protect during start-up or operation of the burner. In case isolating valves cannot be avoided and are mounted
 199 between these required devices and the main lines, these isolating valves shall be locked in the open position
 200 during operation of the equipment by adequate means (e.g. manual lock).

201 4.2.2 Required safety devices

202 4.2.2.1 Manual isolating valve

203 A manually operated isolation valve shall be fitted upstream of the first control device in the gas circuit.
 204 Manual isolation valves shall be so designed or positioned as to prevent inadvertent operation but shall be
 205 easily accessible and capable of rapid operation when required.

206 They shall be so designed that the "OPEN" and "CLOSED" positions are readily distinguishable (e.g. a 90°
 207 turn valve if applicable and available).

208 4.2.2.2 Filter/strainer

209 Special care shall be taken to prevent the ingress of particles, either from the pipework or from the gas, which
 210 would be detrimental to the operation of the equipment by the incorporation of a suitable filter or strainer
 211 immediately downstream of the first manual isolating valve of the TPE. Additional filters/strainers may be
 212 required (e.g. immediately upstream of the automatic shut-off valve). The filter and/or the strainer shall be
 213 positioned in such a way that periodic servicing remains easy. The filtering capacity of the filter/strainer has to
 214 be chosen according to the requirements of downstream equipment.

215 NOTE Normally safety and control devices for gas burners and gas-burning appliances require upstream filters with
 216 filtering capacity $\leq 50 \mu\text{m}$. Strainers with larger mesh size are only suitable for primary cleaning.

217 In case of the installation of a by-pass to the filter / strainer, an identical filtering device shall be installed on
 218 the by-pass line.

219 The intervals for checking the filter and/or the strainer shall be specified in the instruction handbook.

220 4.2.2.3 Gas pressure regulator

221 A gas pressure regulator shall be incorporated where this is necessary for control of the pressure and the flow
 222 rate.

223 Gas pressure regulators when fitted shall comply with ISO 23551-2 as appropriate.

224 If the outlet side of the gas pressure regulator and/or the following line section with equipment up to the burner
 225 is/are not designed for the maximum supply pressure (inlet pressure upstream of the gas pressure regulator
 226 under fault conditions) an over pressure cut off device shall be installed upstream of the gas pressure
 227 regulator shutting off the gas supply before an excessively high pressure occurs.

228 The over pressure cut off device shall be:

- 229 — a mechanical valve which measures the gas pressure downstream of the gas pressure regulator by
 230 means of an impulse line and closes by spring force in case the pressure exceeds the set response
 231 pressure or
- 232 — an automatic shut-off valve according ISO 23551-1 actuated by an overpressure switch according
 233 IEC 60730-2-6 installed downstream of the gas pressure regulator. In this case, signal processing
 234 has to fulfil the requirements of a protective system according to ISO 13577-4.

235 A small capacity relief valve (token relief valve) shall always be applied downstream of the gas pressure
 236 regulator, if an over pressure cut-off device is installed to vent small leakages of the high pressure cut-off.

237 Pressure adjustment on the gas pressure regulator shall only be possible with a special tool provided for the
 238 task.

239 Where the gas for the pilot burner is taken from upstream of the gas pressure regulator to the main burner(s),
 240 the pilot burner shall be equipped with a separate gas pressure regulator.
