ISO 14385-1:2014(E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 146, *Air quality*, Subcommittee SC 1, *Stationary source emissions*.

ISO 14385 consists of the following parts, under the general title *Stationary source emissions — Greenhouse gases*:

- *Part 1: Calibration of automated measuring systems*
- *Part 2: Ongoing quality control of automated measuring systems*

Introduction

The measurement of greenhouse gas emissions (carbon dioxide, nitrous oxide, methane) in a framework of emission trading requires an equal and known quality of data.

This part of ISO 14385 describes the quality assurance procedures for calibration and ongoing quality control needed to ensure that automated measuring systems (AMS) installed to measure emissions of greenhouse gases to air are capable of meeting the uncertainty requirements on measured values specified, e.g. by legislation, competent authorities, or in an emission trade scheme.

Stationary source emissions — Greenhouse gases —

Part 1: Calibration of automated measuring systems

1 Scope

This part of ISO 14385 specifies the procedures for establishing quality assurance for automated measuring systems (AMS) installed on industrial plants for the determination of the concentration of greenhouse gases in flue and waste gas and other flue gas parameters.

This part of ISO 14385 specifies a procedure to calibrate the AMS and determine the variability of the measured values obtained by an AMS, which is suitable for the validation of an AMS following its installation.

This part of ISO 14385 is designed to be used after the AMS has been accepted according to the procedures specified in ISO 14956.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 14385-2, *Stationary source emissions — Greenhouse gases — Part 2: Ongoing quality control of automated measuring systems*

ISO 14956, *Air quality — Evaluation of the suitability of a measurement procedure by comparison with a required measurement uncertainty*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

automated measuring system

AMS

measuring system permanently installed on site for continuous monitoring of emissions

Note 1 to entry: An AMS is a method which is traceable to a reference method.

Note 2 to entry: Apart from the analyser, an AMS includes facilities for taking samples (e.g. sample probe, sample gas lines, filters, flow meters, regulators, delivery pumps, blowers) and for sample conditioning (e.g. dust filter, water vapour removal devices, converters, diluters). This definition also includes testing and adjusting devices that are required for regular functional checks.

3.2

calibration function

linear relationship between the values of the SRM and the AMS with the assumption of a constant residual standard deviation

3.3

calibration gas

gas of known composition that can be used to check the response of the AMS

ISO 14385-1:2014(E)

3.4

competent authority

organization or organizations which implement the requirements of legislation and regulate installations which must comply with the requirements of legislation

3.5

confidence interval

interval estimator (T_1 , T_2) for the parameter θ with the statistics T_1 and T_2 as interval limits and for which it holds that $P[T_1 < \theta < T_2] \geq 1 - \alpha$

Note 1 to entry: The two-sided 95 % confidence interval of a normal distribution is illustrated in [Figure 1](#), where

$T_1 = \theta - 1,96\sigma_0$ is the lower 95 % confidence limit;

$T_2 = \theta + 1,96\sigma_0$ is the upper 95 % confidence limit;

$I = T_2 - T_1 = 2 \times 1,96 \times \sigma_0$ is the length of the 95 % confidence interval;

$\sigma_0 = I / (2 \times 1,96)$ is the standard deviation associated with a 95 % confidence interval;

n is the number of observed values;

f is the frequency;

m is the measured value.

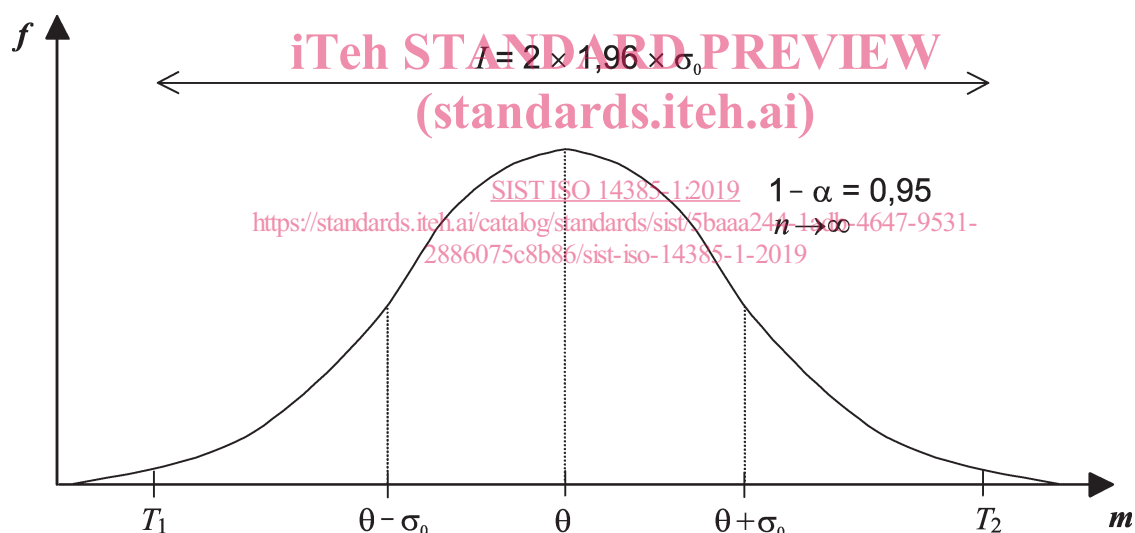

Figure 1 — Illustration of the 95 % confidence interval of a normal distribution

Note 2 to entry: In this part of ISO 14385, the standard deviation, σ_0 , is estimated by parallel measurements with an SRM. It is assumed that the requirement for σ_0 , presented in terms of an allowable uncertainty budget, i.e. variability is provided by the regulators. In the procedures of this part of ISO 14385, the premise is that the required variability is given as σ_0 itself, or as a quarter of the length of the full 95 % confidence interval.

[SOURCE: ISO 3534-1:2006, 1.28, modified: Figure 1 has been added. Notes 1 and 2 are different.]

3.6

drift

monotonic change of the calibration function over stated maintenance interval, which results in a change of the measured value

3.7

extractive AMS

AMS having the detection unit physically separated from the gas stream by means of a sampling system

3.8**in-situ AMS**

AMS having the detection unit in the gas stream, or in a part of it

3.9**instrument reading**

indication of the measured value directly provided by the AMS without using the calibration function

3.10**legislation**

directives, acts, ordinances, and regulations

3.11**low-level cluster**

cluster of measurement values less than the maximum permissible uncertainty and between 0 % and 15 % of the lowest measuring range

3.12**measurand**

particular quantity subject to measurement^[5]

3.13**measured component**

constituent of the waste gas for which a defined measurand is to be determined by measurement

3.14**measured value**

estimated value of the measurand derived from an output signal

Note 1 to entry: This usually involves calculations related to the calibration process and conversion to required quantities

Note 2 to entry: A measured value is a short-term average. The averaging time can be, e.g. 10 min, 30 min, or 1 h.

3.15**period of unattended operation**

maximum admissible interval of time for which the performance characteristics will remain within a predefined range without external servicing, e.g. refill, calibration, adjustment

Note 1 to entry: This is also known as the maintenance interval.

3.16**peripheral parameter**

specified physical or chemical quantity which is needed for conversion of the AMS measured value to standard conditions

3.17**peripheral AMS**

AMS used to gather the data required to convert the AMS measured value to standard conditions

Note 1 to entry: A peripheral AMS is used to measure water vapour, temperature, pressure, and oxygen.

3.18**peripheral SRM**

SRM used to gather the data required to convert the SRM measured values to AMS or standard conditions

Note 1 to entry: A peripheral SRM is used to measure water vapour, temperature, pressure, and oxygen.

3.19**precision**

closeness of agreement of results obtained from the AMS for successive zero readings and successive span readings at defined time intervals

ISO 14385-1:2014(E)**3.20****reference material**

substance or mixture of substances with a known concentration within specified limits, or a device of known characteristics

Note 1 to entry: Normally used are calibration gases, gas cells, gratings, or filters.

3.21**response time**

t₉₀

time interval between the instance of a sudden change in the value of the input quantity to an AMS and the time as from which the value of the output quantity is reliably maintained above 90 % of the correct value of the input quantity

Note 1 to entry: The response time is also referred to as the 90 % time.

3.22**span reading**

instrument reading of the AMS for a simulation of the input parameter at a fixed elevated concentration. This simulation should test as much as possible all the measuring elements of the system, which contribute significantly to its performance.

Note 1 to entry: The span reading is approximately 80 % of the measured range.

3.23**standard conditions**

conditions as given in legislation to which measured values have to be standardized

3.24**standard deviation**

positive square root of the mean squared deviation from the arithmetic mean, divided by the degrees of freedom

<https://standards.iteh.ai/catalog/standards/sist/5baaa244-1adb-4647-9531-2886075c8b86/sist-iso-14385-1-2019>

Note 1 to entry: The number of degrees of freedom is the number of measurements minus 1.

3.25**Standard Reference Method****SRM**

method described and standardised to define a measurand, temporarily conducted on site for verification purposes

Note 1 to entry: Also known as a reference method.

3.26**uncertainty**

parameter associated with the result of a measurement that characterises the dispersion of the values that could reasonably be attributed to the measurand^[5]

3.27**variability**

standard deviation of the differences of parallel measurements between the SRM and AMS

3.28**zero reading**

instrument reading of the AMS on simulation of the input parameter at zero concentration, which shall test as much as possible all the measuring elements of the AMS, that contribute significantly to its performance

4 Symbols and abbreviations

4.1 Symbols

a	intercept of the calibration function
\hat{a}	best estimate of a
b	slope of the calibration function
\hat{b}	best estimate of b
D_i	difference between SRM value y_i and calibrated AMS measured value \hat{y}_i
\bar{D}	average of D_i
E	maximum value of measuring range
k_ν	test value for variability (based on a χ^2 -test, with a β -value of 50 %, for N numbers of paired measurements)
N	number of paired samples in parallel measurements
σ	standard deviation of the differences D_i in parallel measurements
$t_{0,95; N-1}$	value of the t distribution for a significance level of 95 % and a number of degrees of freedom of $N - 1$
u_{inst}	uncertainty due to instability (expressed as a standard deviation)
u_{temp}	uncertainty due to influence of temperature (expressed as a standard deviation)
u_{pres}	uncertainty due to influence of pressure (expressed as a standard deviation)
u_{volt}	uncertainty due to influence of voltage (expressed as a standard deviation)
u_{others}	any other uncertainty that can influence the zero and span reading (expressed as a standard deviation)
x_i	i^{th} measured signal obtained with the AMS at AMS measuring conditions
\bar{x}	average of AMS measured signals x_i
y_i	i^{th} measured value obtained with the SRM
\bar{y}	average of the SRM measured values y_i
$y_{i,s}$	SRM measured value y_i at standard conditions
$y_{s,\text{min}}$	lowest SRM measured value at standard conditions
$y_{s,\text{max}}$	highest SRM measured value at standard conditions
\hat{y}_i	best estimate for the “true value”, calculated from the AMS measured signal x_i by means of the calibration function
$\hat{y}_{i,s}$	best estimate for the “true value”, calculated from the AMS measured signal x_i at standard conditions
$\hat{y}_{s,\text{max}}$	best estimate for the “true value”, calculated from the maximum value of the AMS measured signals x_i at standard conditions
Z	offset (the difference between the AMS zero reading and the zero)
