ISO 16140-1:2016

<https://standards.iteh.ai/catalog/standards/sist/6f3e1c9e-fe76-4aaf-b1a4-f5e7b0750f02/iso-16140-1-2016>

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information \(standards.iteh.ai\)](http://Foreword - Supplementary information (standards.iteh.ai))

The committee responsible for this document is ISO/TC 34, *Food products*, Subcommittee SC 9, *Microbiology*.

This first edition of ISO 16140-1, together with ISO 16140-2, cancels and replaces ISO 16140:2003, which has been technically revised. It also incorporates the Amendment ISO 16140:2003:Amd.1:2011.

ISO 16140 consists of the following parts, under the general title *Microbiology of the food chain — Method validation*:

- *Part 1: Vocabulary*
- *Part 2: Protocol for the validation of alternative (proprietary) methods against a reference method*

The following parts are under preparation:

- *Part 3: Protocol for the verification of reference and validated alternative methods implemented in a single laboratory*
- *Part 4: Protocol for single-laboratory (in-house) method validation*
- *Part 5: Protocol for factorial interlaboratory validation of non-proprietary methods*
- *Part 6: Protocol for the validation of alternative (proprietary) methods for microbiological confirmation and typing*

Introduction

The use of validated methods is an important requirement for obtaining reliable results with a specific method. It also facilitates the comparability of results obtained with the same method in different laboratories. Validation procedures covered by ISO 16140 (all parts) involve various aspects of validation, such as validation of alternative (proprietary) methods, single laboratory validation, validation of (alternative) methods using a limited number of laboratories, and verification of methods (demonstration of a laboratory to correctly apply a validated method). In addition, there is a close link to ISO 17468 describing the procedure for the validation of the standard methods themselves.

Microbiology of the food chain — Method validation —

Part 1: Vocabulary

1 Scope

This part of ISO 16140 defines general terms and definitions relating to method validation of microbiology in the food chain.

This part of ISO 16140 is applicable to the validation of methods for the analysis (detection or quantification) of microorganisms in

- products intended for human consumption,
- products intended for animal feeding,
- environmental samples in the area of food and feed production, handling, and
- samples from the primary production stage.

2 Terms and definitions (standards.iteh.ai)

2.1

acceptability limit

AL

maximum positive or negative acceptable difference between the *reference value* (2.60) (or if not known, the accepted reference value) of a *sample* (2.69) and an individual result obtained when applying the operating procedure of an analytical method

Note 1 to entry: Because *accuracy* (2.2) is defined as ‘the closeness of agreement between a measured quantity value and an assigned quantity value of a measurand’, acceptability limits can be interpreted as the maximum measure of the lack of accuracy for *quantitative methods* (2.57).

2.2

accuracy

measurement accuracy

closeness of agreement between a measured quantity value and an assigned quantity value of a measurand

Note 1 to entry: The concept ‘measurement accuracy’ is not a quantity and is not given a numerical quantity value. A measurement is said to be more accurate when it offers a smaller measurement error.

Note 2 to entry: The term ‘measurement accuracy’ should not be used for measurement *trueness* (2.77) and the term measurement *precision* (2.51) should not be used for ‘measurement accuracy’, which, however, is related to both these concepts.

Note 3 to entry: ‘Measurement accuracy’ is sometimes understood as closeness of agreement between measured quantity values that are being attributed to the measurand.

[SOURCE: JCGM, 2012, modified]

2.3

accuracy profile

graphical representation of the capacity of measurement of the *quantitative method* (2.57), obtained by combining acceptability intervals and *β -expectation tolerance intervals* (2.8), both reported to different levels of the *reference value* (2.60)

Note 1 to entry: For a given measurement method, different accuracy profiles can be drawn, depending on the experimental design where data were collected: under *repeatability conditions* (2.64) or *reproducibility conditions* (2.67), for different matrices, etc.

Note 2 to entry: Calculations of accuracy profile elements depend on experimental design.

2.4

alternative method

method submitted for validation

method of analysis that detects or quantifies, for a given category of products, the same *analyte* (2.6) as is detected or quantified using the corresponding *reference method* (2.59)

Note 1 to entry: The method can be proprietary. The term 'alternative' is used to refer to the entire 'test procedure and reaction system'. This term includes all ingredients, whether material or otherwise, required for implementing the method.

2.5

alternative method result

final result of the qualitative or quantitative analysis for the *alternative method* (2.4)

2.6

analyte

component represented in the name of a measurable quantity

[SOURCE: ISO 17511:2003, 3.2]

Note 1 to entry: For food microbiology, this means a microorganism, group of microorganisms, or its products (e.g. toxins) quantified or detected by the method of analysis.

Note 2 to entry: Possible targets of the techniques that are used for detection or enumeration of the analyte can be DNA/RNA, proteins, lipopolysaccharides, or others.

2.7

assigned value

value that serves as an agreed-upon reference for comparison

Note 1 to entry: It is normally derived from or based on experimental work.

2.8

β -expectation tolerance interval

β -ETI

range of values within which a stated proportion of the population is expected to lie

Note 1 to entry: The stated proportion represents the probability that a value falls between an upper and lower bound of a distribution.

Note 2 to entry: Tolerance intervals tend towards a fixed value as the *sample* (2.69) size increases.

2.9

bias

measurement bias

estimate of a systematic measurement error, or the systematic difference between the quantitative *assigned value* (2.7) and the average of measurement *replicate* (2.65) results

2.10**blind replicates**

set of *samples* (2.69) submitted to evaluate performance in which the presence and/or concentration of the *analyte* (2.6) is unknown to the analyst

Note 1 to entry: Within *validation* (2.81) studies, *blind replicates* (2.10) are used within the *interlaboratory study* (2.33). The *organizing laboratory* (2.45) prepares *samples* (2.69) and sends them to the *collaborators* (2.13). These samples are labelled (marked) in such a way that the *collaborator* (2.13) does not know if they contain the *analyte* (2.6), or not.

2.11**category**

group of *sample* (2.69) *types* (2.78) of the same origin

EXAMPLE Heat-processed milk and dairy products.

2.12**certified reference material****CRM**

reference material (2.58) characterized by a metrologically valid procedure for one or more specified properties, accompanied by a certificate that provides the value of the specified property, its associated uncertainty, and a statement of metrological traceability

Note 1 to entry: Adapted from ISO Guide 30 and ISO Guide 35.

2.13**collaborator**

individual laboratory technician, who works completely independently from other collaborators, using different sets of blind *samples* (2.69) or *test portions* (2.75)

2.14**combined standard deviation****combined standard uncertainty**

standard measurement uncertainty that is obtained using the individual standard uncertainties associated with the input quantities in a measurement model

[SOURCE: JCGM, 2012, modified]

2.15**confidence interval**

value $(1 - \alpha)$ of the probability associated with a confidence interval or a statistical coverage interval

EXAMPLE Confidence intervals can be obtained for arithmetic means, standard deviations, regression coefficients, etc.

Note 1 to entry: $(1 - \alpha)$ is often expressed as a percentage.

2.16**confidence level**

specific probability of obtaining some result from a *sample* (2.69) if it did not exist in the population as a whole

Note 1 to entry: The usual levels of probability are 95 % or 99 %, but any level can be used.

2.17**confirmation procedure or test**

procedure or test which is carried out to verify a presumptive result

Note 1 to entry: Not all methods have a confirmation procedure.

2.18

count

observed number of objects

EXAMPLE Colonies or plaques.

2.19

coverage factor

number larger than one by which a combined standard measurement uncertainty is multiplied to obtain an expanded measurement uncertainty

[SOURCE: JCGM, 2012, modified]

2.20

detection level

<qualitative methods> minimum concentration of organisms that produce evidence of growth in a liquid medium with a probability of $P = 0,95$ when inoculated into a defined culture medium and incubated under defined conditions

Note 1 to entry: The theoretical level that conforms to this definition is three viable cells in an inoculum volume.

Note 2 to entry: The term '*sensitivity*' ([2.71](#)) is discouraged for detection level.

2.21

environmental sample

sample ([2.69](#)) from a surface of equipment or from the production environment, or from water used in the manufacturing process

2.22

exclusivity study

study involving pure *non-target strains* ([2.44](#)), which can be potentially cross-reactive, but are not expected to be detected or enumerated by the *alternative method* ([2.4](#)).

2.23

false-negative test result

negative result by the tested method that is actually confirmed as a positive result

2.24

false-positive test result

positive result by the tested method that is actually confirmed as a negative result

2.25

feed

feedstuff

any material or product intended to be, or reasonably expected to be, used for animal consumption

2.26

fitness for purpose

degree whether data produced by a measurement process enables a user to make technically and administratively correct decisions for a stated purpose

2.27

food

foodstuff

any material or product intended to be, or reasonably expected to be, used for human consumption

2.28

fractional recovery

validation ([2.81](#)) criterion that is satisfied when *replicate* ([2.65](#)) *samples* ([2.69](#)) of either the *alternative method* ([2.4](#)) or *reference method* ([2.59](#)) yield 50 % (range 25 % – 75 %) positive responses

2.29**homogeneity**

condition of being of uniform structure or composition with respect to one or more specified properties

Note 1 to entry: A *reference material* (2.58) is said to be homogeneous with respect to a specified property if the property value, as determined by tests on *samples* (2.69) of specified size, is found to lie within the specified uncertainty limits, the samples being taken either from different supply units (bottles, packages, etc.) or from a single supply unit.

[SOURCE: ISO Guide 30:1992, 2.6]

2.30**identification procedure or test**

procedure or test yielding the identity of the *analyte* (2.6)

2.31**inclusivity study**

study involving pure *target strains* (2.74) to be detected or enumerated by the *alternative method* (2.4)

2.32**in-house reference material****IRM**

non-certified material or substance, produced by one laboratory, one or more of whose property values are sufficiently homogeneous and well established to be used for *validation* (2.81)

2.33**interlaboratory study**

study performed by multiple laboratories testing identical *samples* (2.69) at the same time, the results of which are used to estimate alternative-method performance parameters

Note 1 to entry: The aim of an interlaboratory study is to determine the variability of the results obtained in different laboratories using identical samples.

2.34**item**

single specified *food* (2.27), *feed* (2.25), environmental, or primary production *matrix* (2.38)

EXAMPLE Food *category* (2.11): heat-processed milk and dairy products; food *type* (2.78): pasteurized dairy product; food item: milk-based desserts.

2.35**level of detection****LOD_x**

<qualitative methods> measured *analyte* (2.6) concentration, obtained by a given measurement procedure, for which the *probability of detection* (2.53) is *x*

EXAMPLE LOD₅₀ is the level of detection for which 50 % of tests give a positive result.

Note 1 to entry: The term 'level of detection' is used for qualitative methods in microbiology based on *replicate* (2.65) analyses with three different inoculation levels of the target *analyte* (2.6) in a tested *matrix* (2.38). The replicates are analysed, and the number of positive results is recorded (e.g. 20 %, 70 %, and 100 %) respectively at each inoculation level. These data are then used to determine the number of cells that would give 50 % positive using a generalized linear model (see ISO 16140-2). This differs from the procedure used for chemical and physical methods for which a 'limit of detection' is defined as the lowest quantity of an analyte that can be distinguished from the absence of that analyte with a stated *confidence level* (2.16).

2.36**limit of quantification****LOQ**

limit of determination

<quantitative methods> lowest *analyte* (2.6) concentration that can be quantified with an acceptable level of *precision* (2.51) and *trueness* (2.77) under the conditions of the test
